IHC WORKUP OF KIDNEY TUMORS: WHAT'S THE POINT IN GETTING ALL WORKED UP?

Cristina Magi-Galluzzi, MD, PhD

Professor of Pathology
Director of Anatomic Pathology
The C. Bruce Alexander Endowed Professorship in Pathology

GUPS Genitourinary Pathology Society

UAB HEERSINK SCHOOL OF MEDICINE
The University of Alabama at Birmingham

SCHOOL OF MEDICINE

I HAVE NO DISCLOSURES

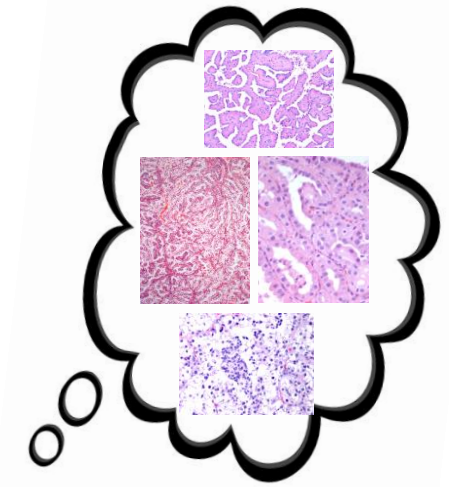
OBJECTIVES

- Distinguish renal tumors with favorable prognosis from tumor with aggressive behavior
- Review key morphologic and IHC features to recognize distinct entities
- Develop an algorithm based on morphologic features to reduce renal tumor-induced anxiety

OBJECTIVES

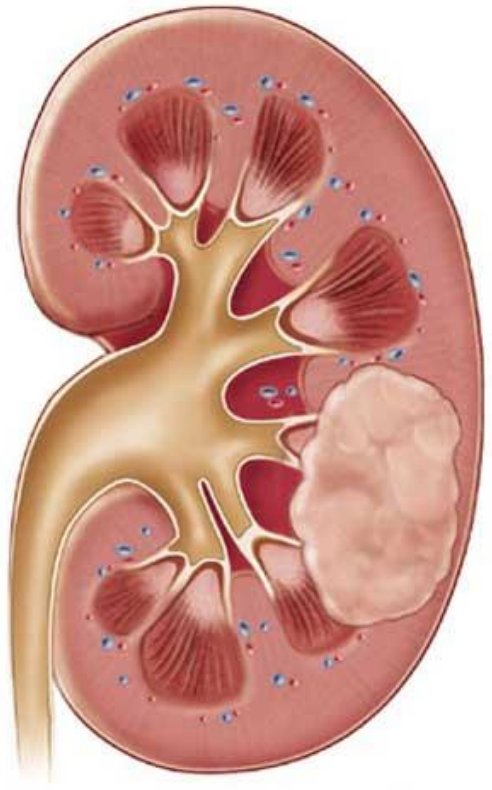
DO NOT PANIC!

KEEP CALM



TUMORS OF THE KIDNEY

- 2% of all cancer globally
- 2% of cancer deaths
- 5-year relative survival rates (2009-2015)
  - Localized 93%
  - Regional 70%
  - Distant 12%
  - All stage combined 75%
- Increase incidence since 1990s:
  - 7th most common cancer in men
  - 10th most common cancer in women
- 60% incidental (and increasing)



2-5% associated with **inherited syndromes**

Hereditary Renal Tumors

Syndrome	Clinical Manifestations	Gene (Chr.) - Protein	Histologic Features
von Hippel-Lindau **(VHL)** syndrome	Clear cell RCC, pheo, pancreatic endocrine tumors, CNS and retinal hemangioblastomas	*VHL* (3p25) - VHL protein	Clear cell RCC
Hereditary leiomyomatosis and RCC **(HLRCC)**	RCC, Leiomyomas of skin and uterus	*FH* (1q42.1) – Fumarate hydratase	Variable architectural patterns, prominent nucleoli with perinucleolar halo
Birt-Hogg-Dubé syndrome **(BHD)**	Renal tumors, fibrofolliculomas, pulmonary cysts	*BHD/FLCN* (17p11.2) – Folliculin (FLCN)	HOCT, oncocytoma, chromophobe RCC
Tuberous sclerosis complex **(TSC)**	Multiple renal AML, RCCs, Cardiac rhabdomyomas, Hamartomas, Neurologic disorders/seizures	*TSC1* (9q34) - Hamartin *TSC2* (16p13.3) - Tuberin	AML, renal cysts, RCC ~to clear cell, TCEB1-mutated RCC, chromophobe RCC, oncocytoma, or unclassified
Succinate dehydrogenase **(SDH)-**associated pheo/ paraganglioma syndrome	Bilateral and extraadrenal pheo/paraganglioma, RCC and other malignancies	*SDHB* (1p36.1-p35) – SDH subunit B	Cytoplasmic inclusions containing pale eosinophilic to clear material
Hereditary papillary RCC	Type I papillary RCC	*MET* (7q31) - MET	Type I papillary RCC

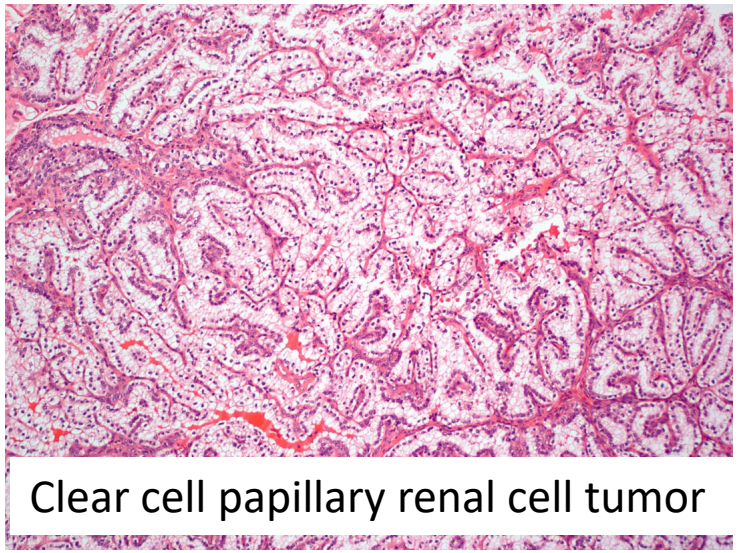
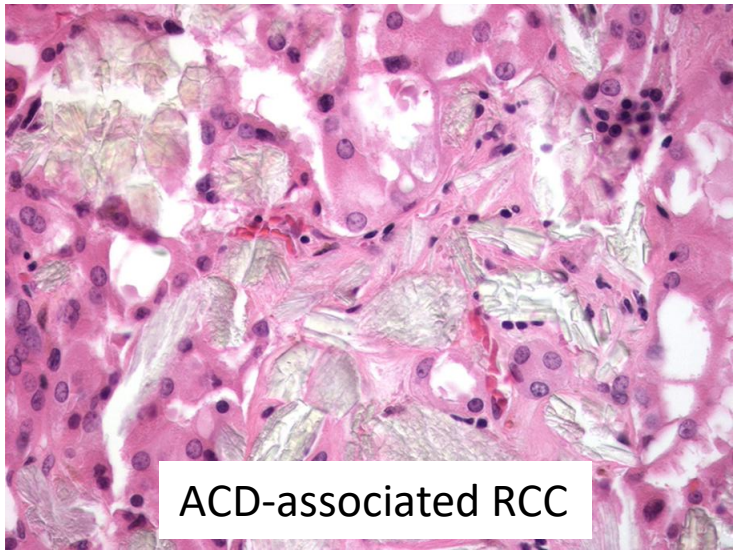
Renal Tumors – WHO 2022

Renal cell tumours

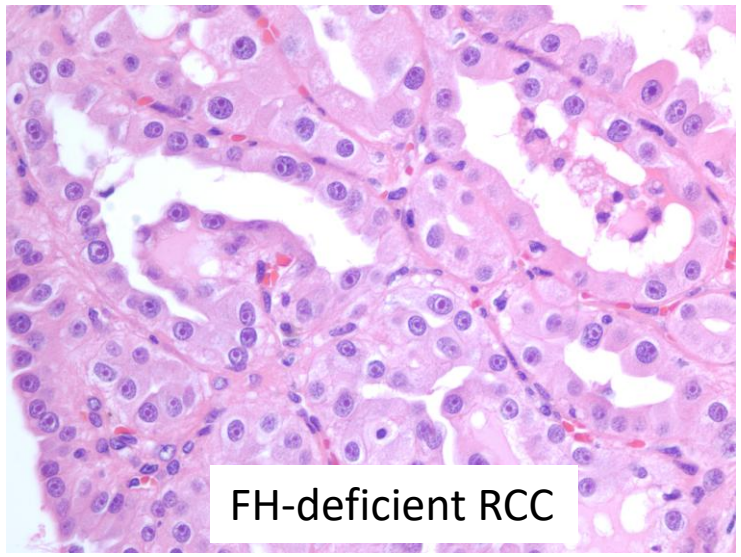
- 3.1.0.1: Renal cell tumours: Introduction
- 3.1.1: Clear cell renal tumours
  - 3.1.1.1: Clear cell renal cell carcinoma
  - 3.1.1.2: Multilocular cystic renal neoplasm of low malignant potential
- 3.1.2: Papillary renal tumours
  - 3.1.2.1: Renal papillary adenoma
  - 3.1.2.2: Papillary renal cell carcinoma
- 3.1.4: Oncocytic and chromophobe renal tumours
  - 3.1.4.1: Oncocytoma of the kidney
  - 3.1.4.2: Chromophobe renal cell carcinoma
  - 3.1.4.3: Other oncocytic tumours of the kidney
- 3.1.5: Collecting duct tumours
  - 3.1.5.1: Collecting duct carcinoma
- 3.1.6: Other renal tumours
  - 3.1.3.1: Clear cell papillary renal cell tumour
  - 3.1.2.3: Mucinous tubular and spindle cell carcinoma
  - 3.1.6.1: Tubulocystic renal cell carcinoma
  - 3.1.6.2: Acquired cystic disease-associated renal cell carcinoma
  - 3.1.6.3: Eosinophilic solid and cystic renal cell carcinoma
  - 3.1.6.4: Renal cell carcinoma NOS
- 3.1.7: Molecularly defined renal carcinomas
  - 3.1.7.1: TFE3-rearranged renal cell carcinomas
  - 3.1.7.2: TFEB-rearranged renal cell carcinomas
  - 3.1.7.3: ELOC (formerly TCEB1)-mutated renal cell carcinoma
  - 3.1.7.4: Fumarate hydratase-deficient renal cell carcinoma
  - 3.1.7.5: Succinate dehydrogenase-deficient renal cell carcinoma
  - 3.1.7.6: ALK-rearranged renal cell carcinomas
  - 3.1.5.2: SMARCB1-deficient renal medullary carcinoma



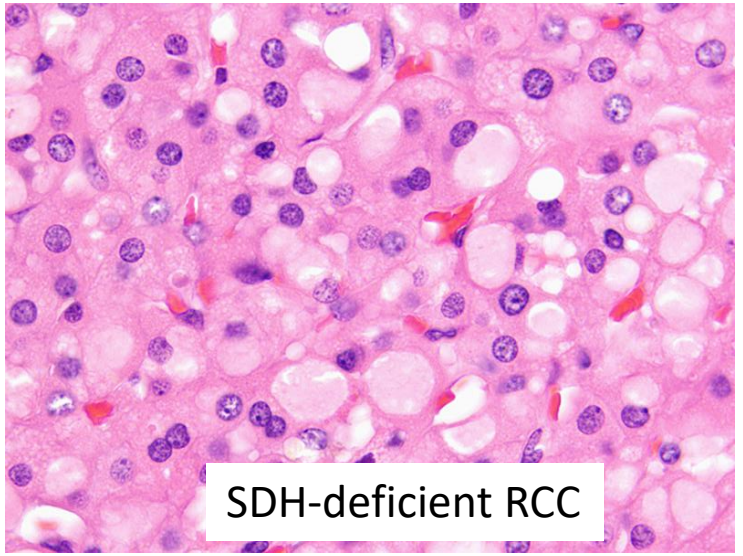
Clear cell papillary renal cell tumor



ACD-associated RCC



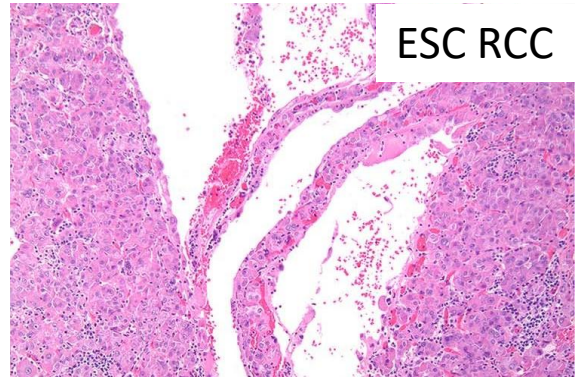
FH-deficient RCC

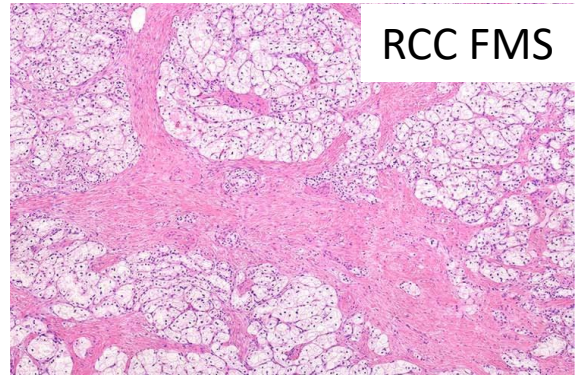


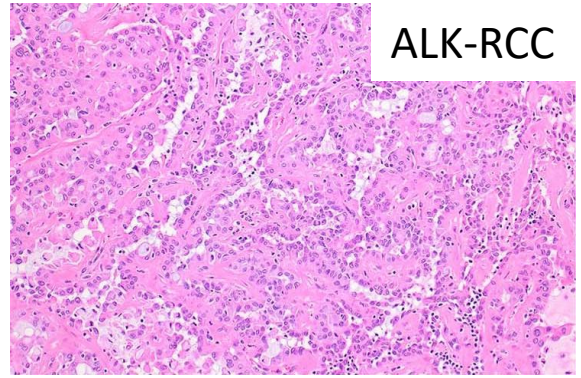
SDH-deficient RCC

Renal Tumors – Novel Entities

Type	Clinical features	Morphology	IHC	Molecular features	Prognosis	2016 WHO/Status
Eosinophilic solid and cystic RCC (ESC RCC)	Mostly females, ≤10% in TSC patients	Solid and cystic, voluminous eosinophilic cells, cytoplasmic coarse granularity	**CK20+,** CK7−, CD117−, vimentin+, **cathepsin K+**	Somatic bi-allelic loss or mutations of *TSC1* and *TSC2*	Good, rare cases aggressive (5–10%)	No
RCC with fibromyomatous stroma (RCC FMS)	No specific clinical features; ≤10% in TSC patients	Fibromyomatous stroma and clear cell areas with elongated, branching tubules, focal papillary morphology	**CK7+** CAIX+ CD10+ vimentin+	*TSC1/MTOR* mutations, some with *ELOC1* (*TCEB1*) mutations and monosomy 8, no *VHL* mutations	Usually favorable	Yes /Emerging/ provisional entity
Anaplastic lymphoma kinase rearrangement-associated RCC (ALK-RCC)	Adults (younger middle age or older), pediatric with sickle cell trait, medullary location	Variable admixed patterns, often mucinous/myxoid background; papillary; Medullary CA-like morphology in children	**ALK+,** PAX8+, non-specific, rare cases TFE3+ in children (without translocation)	*ALK* rearrangement in all (various fusion partners)	**Adverse** (metastasis, death) in about 25%	Yes/emerging /provisional entity

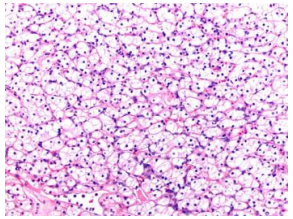


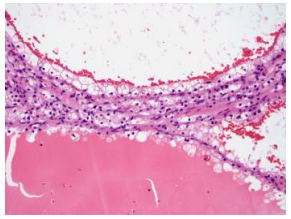


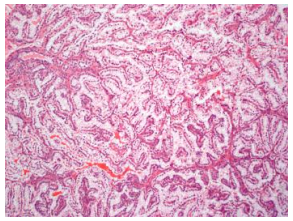


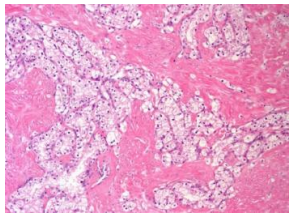
Trpkov et al. Mod Path 2021, GUPS

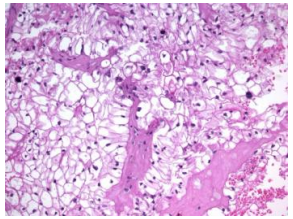
RENAL TUMOR WITH CLEAR CELLS











Tumor type	Clinical features	Morphology	IHC	Molecular features	Prognosis
Clear cell RCC (CCRCC)	~70% of renal tumors - 10% multifocal - 3% bilateral	Solid/acinar growth with delicate sinusoidal vascular pattern	**CAIX+, CK7–**/+ CD117– vimentin+ AMACR-/+	*VHL* mutations (>80%) or hypermethylation (8%) *PBRM1, SETD2, KDM5C, BAP1 mutations*	Depends on grade/stage
Multilocular cystic renal neoplasm of low malignant potential (MCRN-LMP)	- Male predom. - Rare variant of CCRCC	Cysts with thin fibrous septa lined by 1 or few layers of clear cells	**CAIX+** CK7+/-	*VHL* gene alterations similar to CCRCC 3p deletion by FISH in 74%	Excellent prognosis
Clear cell papillary renal cell tumor*	- Sporadic or in ACKD 4th most common renal tumor	Tubulopapillary architecture with compressed tubules lined by clear cells	**CK7+, CAIX+ (cup-like)** AMACR- CD10-; GATA3+	No LOH of 3p; no VHL mutations/methylation No chr. 7/17 trisomy	Favorable prognosis
RCC with fibromyomatous stroma	- Sporadic or in TSC patients (≤10%)	Fibromyomatous stroma, branching tubules with clear cells, focal papillary	**CK7+, CAIX+ CD10+** vimentin+	*TSC1/MTOR* mutations, some with *ELOC1* (*TCEB1*) mutations, monosomy 8, no *VHL* mutations	Usually favorable
TFE3-rearranged RCC*	Peak age: 20-29	Papillae lined by clear cells; broad spectrum	Cathepsin K+/- MelanA/HMB+/-	Translocations involving *TFE3* on chr. Xp11.2	Aggressive 47%
TFEB-rearranged RCC*	Peak age: 30-39 Female predom.	Usually biphasic morphology	**Cathepsin K+ MelanA/HMB+**	*Alpha-TFEB* gene fusion (MALAT1-TFEB)	Aggressive 17%

*papillary features

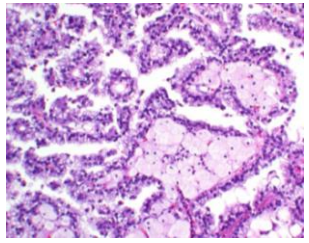
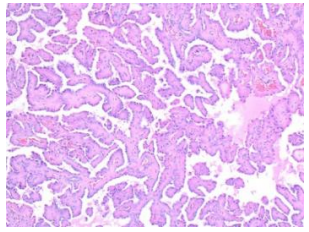
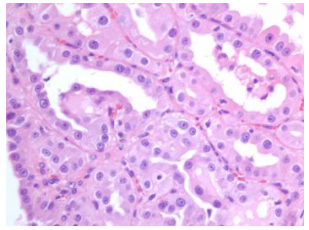
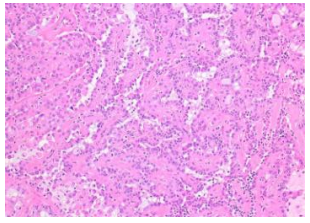
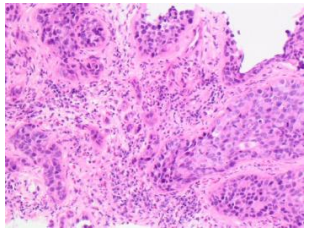
RENAL TUMOR WITH PAPILLARY ARCHITECTURE









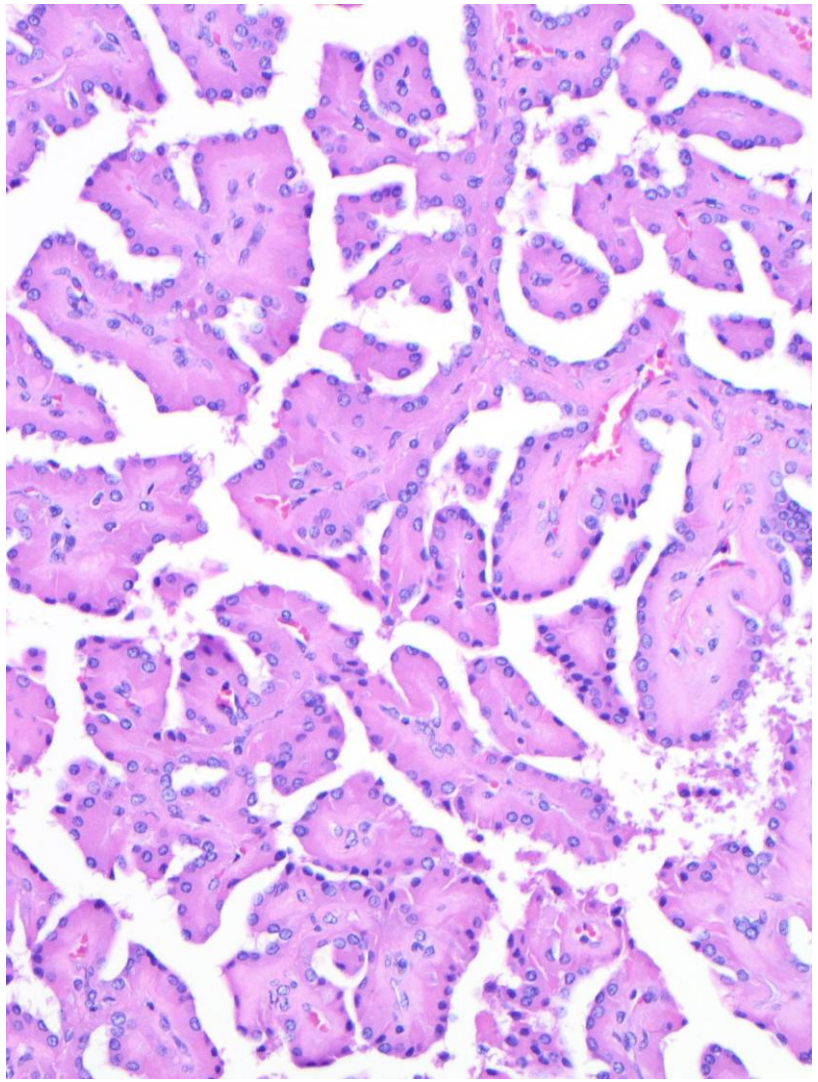


Tumor type	Clinical features	Morphology	IHC	Molecular features	Prognosis
Papillary renal cell carcinoma (PRCC) (type 1)	~15% of renal tumors; 30-49% multifocal 10% bilateral Most sporadic	Papillae lined by single layer of small cells with scant, pale cytoplasm, low grade nuclei; foamy macrophages; psammoma bodies	**CK7+ AMACR+** CAIX-	Gain of chr. 7 ± chr.17 Loss of Y chr. Germline mutations of MET (7q31)	Favorable prognosis
Oncocytic papillary RCC	Sporadic and in patients with ESRD, ACKD	Papillary/tubulopapillary, hyalinized cores, single layer of eosinophilic cells with low grade nuclei, reverse polarity	CK7+ AMACR+ CD10+/- **GATA3+**	Frequent KRAS mutations	Favorable prognosis
FH-deficient RCC (HLRCC)	Cutaneous and uterine smooth muscle tumors; unilateral renal tumors	Papillary/tubulopapillary, solid architecture; enlarged nuclei with prominent eosinophilic nucleolus; abundant eosinophilic cytoplasm	**FH-2SC+** CK7-, CAIX-	Germline mutation of *FH* (1q42.3-1q43), encoding fumarate hydratase	Aggressive behavior
ALK-RCC	Adults (younger middle age or older), pediatric with sickle cell trait, medullary location	Variable admixed patterns, often mucinous/myxoid background; medullary CA-like morphology in children; papillary	**ALK+, INI1+** TFE3+ rare in children - no translocation	*ALK* rearrangement (various fusion partners)	Adverse (metastasis, death) in about 25%
Upper tract urothelial carcinoma (UTUC)	Positive urine cytology; prior or concurrent history of UC elsewhere in the urinary tract	Papillary, solid architecture; enlarged nuclei; infiltrates renal parenchyma, between tubules	**CK7+, GATA3+ P63+ PAX8-/+**	Chr. amplification and losses; *p53* mutations; Lynch syndrome	Aggressive behavior

ONCOCYTIC PAPILLARY RCC, LOW-GRADE (PAPILLARY RENAL NEOPLASM WITH REVERSE POLARITY)

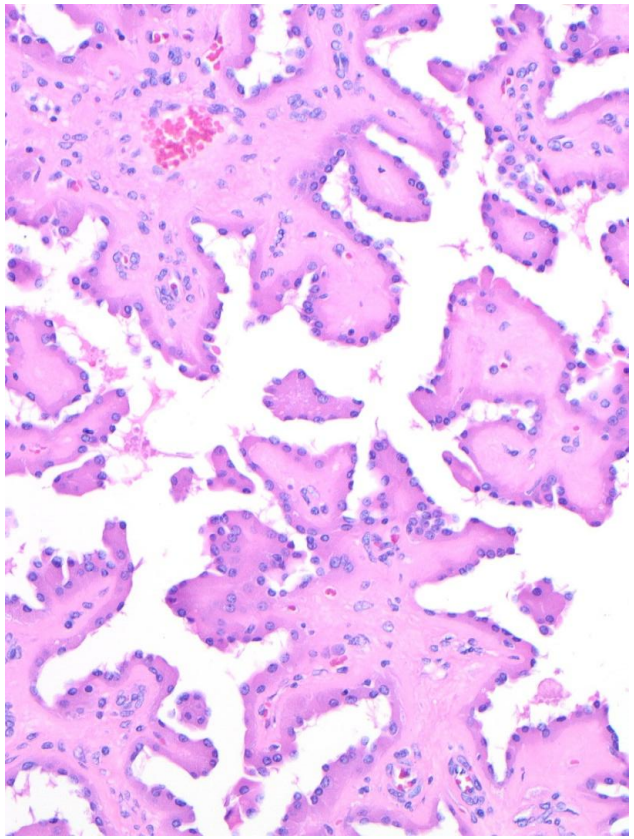
- Papillary/tubulopapillary architecture
- Hyalinized/edematous cores
- Single layer of eosinophilic cells with low grade nuclei (ISUP grade 1-2)
- Inverted nuclear pattern
- CK7, AMACR, GATA3 +; CD10 +/-
- KRAS missense mutation

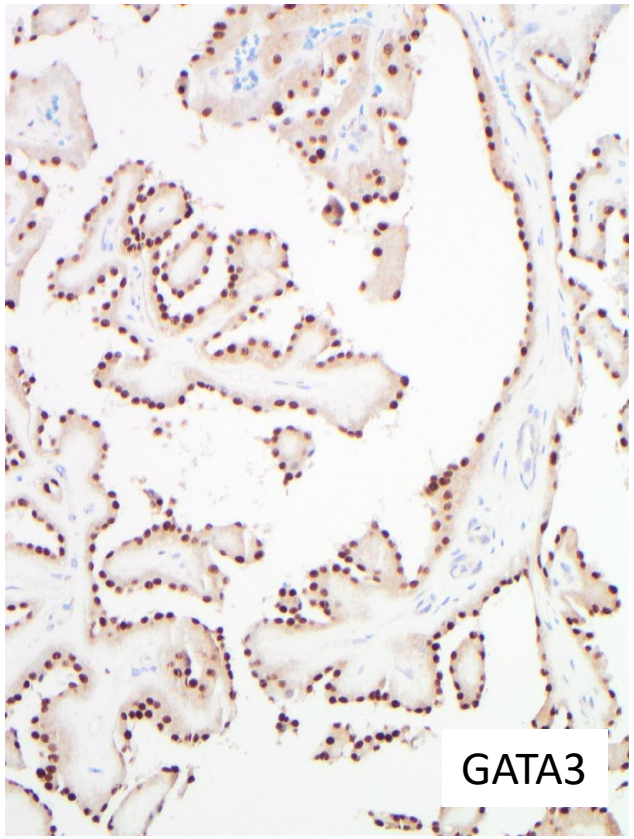
- No mitosis
- No necrosis
- No intracellular hemosiderin
- No foamy macrophages
- No psammoma bodies

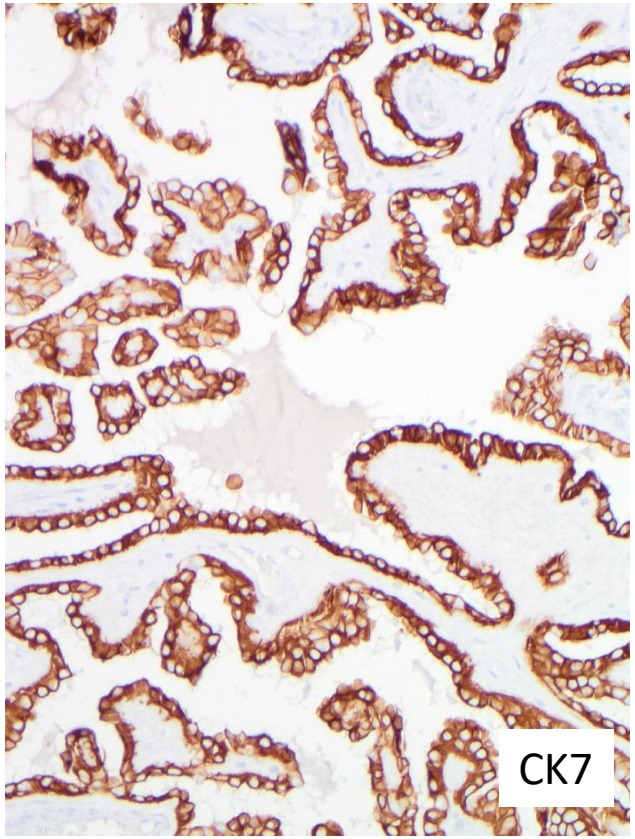


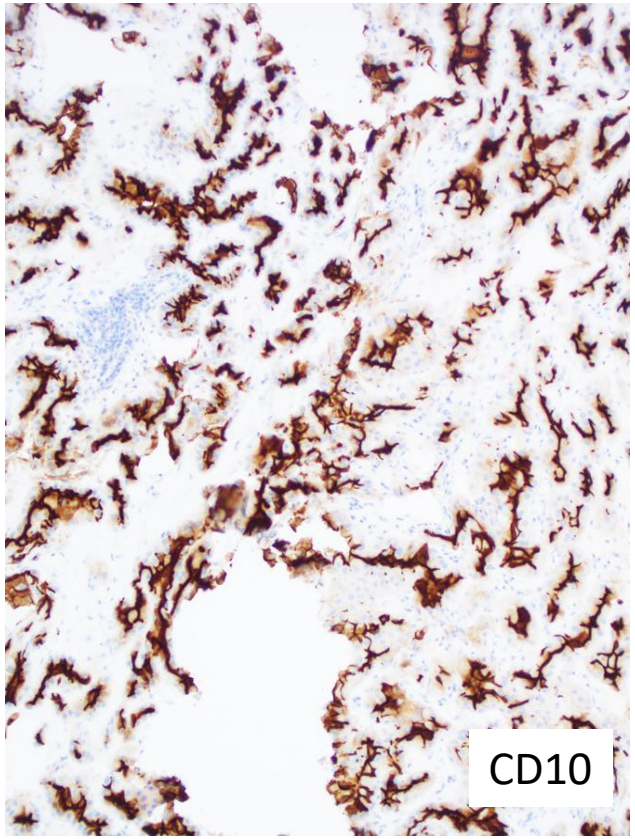
Kunju et al. Hum Pathol 2008; Park et al. Pathol Int 2009; Hes et al. Pathology 2013; Al-Obaidy et al. AJSP 2019, Chang et al. Histopathology 2021

ONCOCYTIC PAPILLARY RCC, LOW-GRADE (PAPILLARY RENAL NEOPLASM WITH REVERSE POLARITY)









HEREDITARY LEIOMYOMATOSIS AND RENAL CELL CARCINOMA SYNDROME-ASSOCIATED RCC (HLRCC)

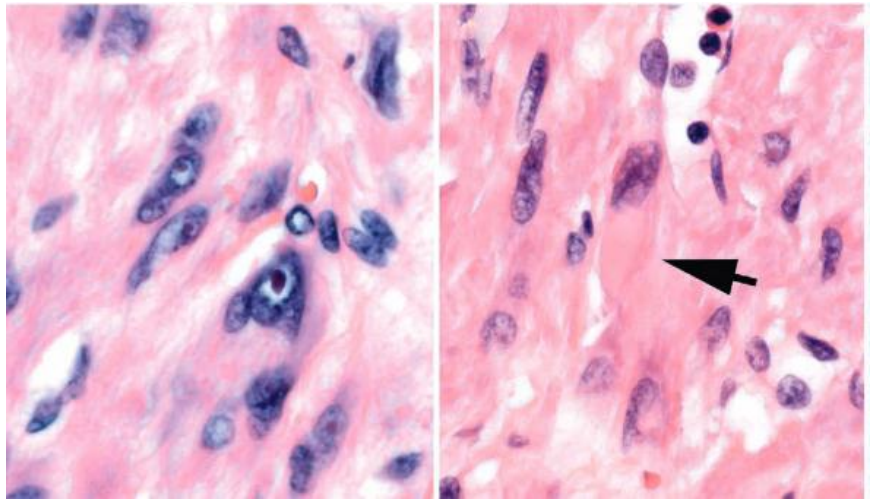
- Autosomal dominant
- Germline mutation of FH gene (1q42.3-1q43)

<u>Features definitional for HLRCC</u>:

- Multiple biopsy-proven cutaneous piloleiomyomas

or

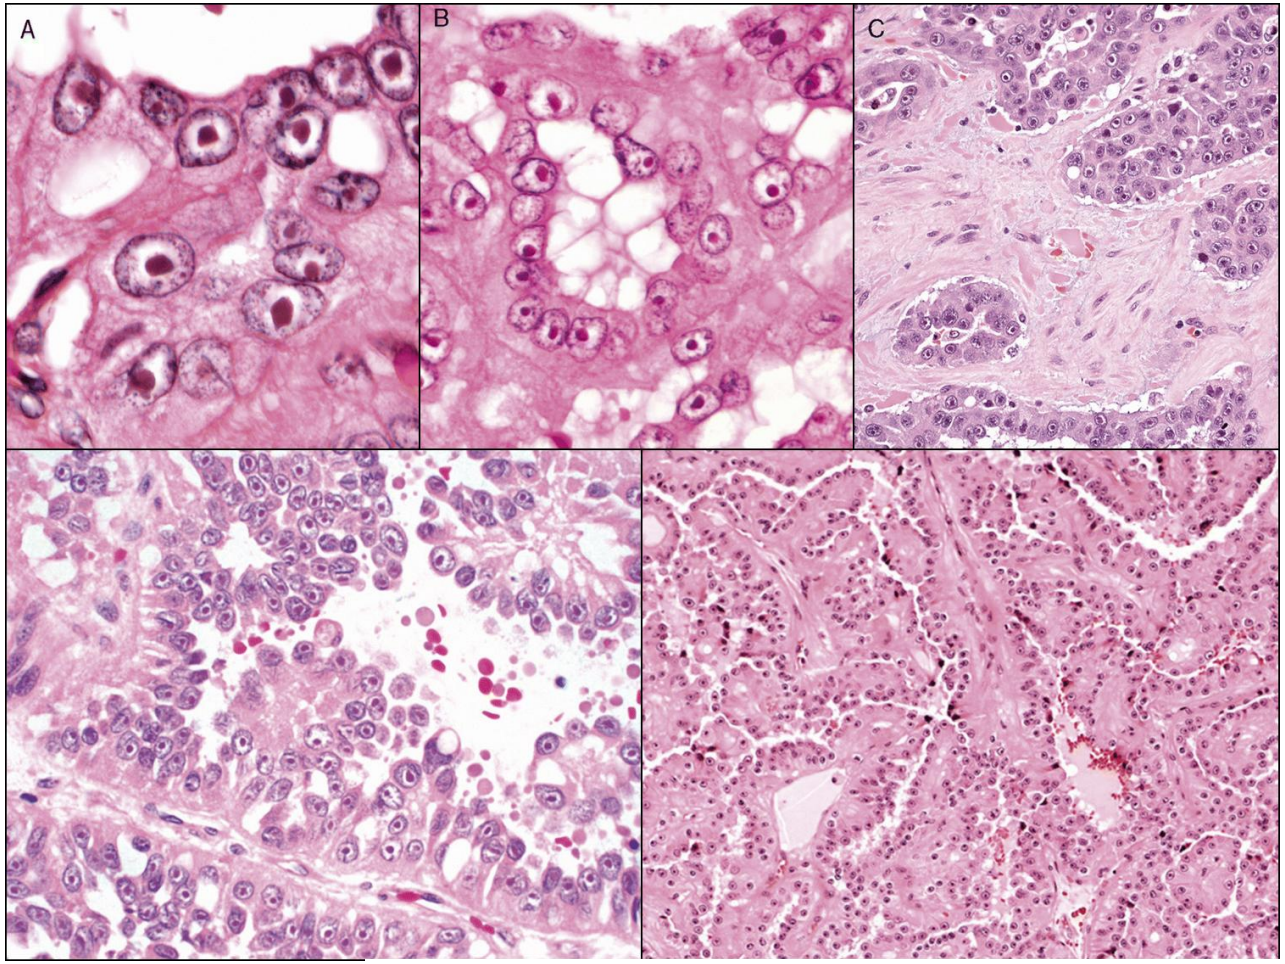
- Two of the following minor criteria:
  - Surgical treatment for symptomatic uterine leiomyomas before age 40
  - RCC with papillary features before age 40
  - 1st degree family member who meets these criteria



Howitt et al. *Diagnostic Gynecologic and Obstetric Pathology*, 2018

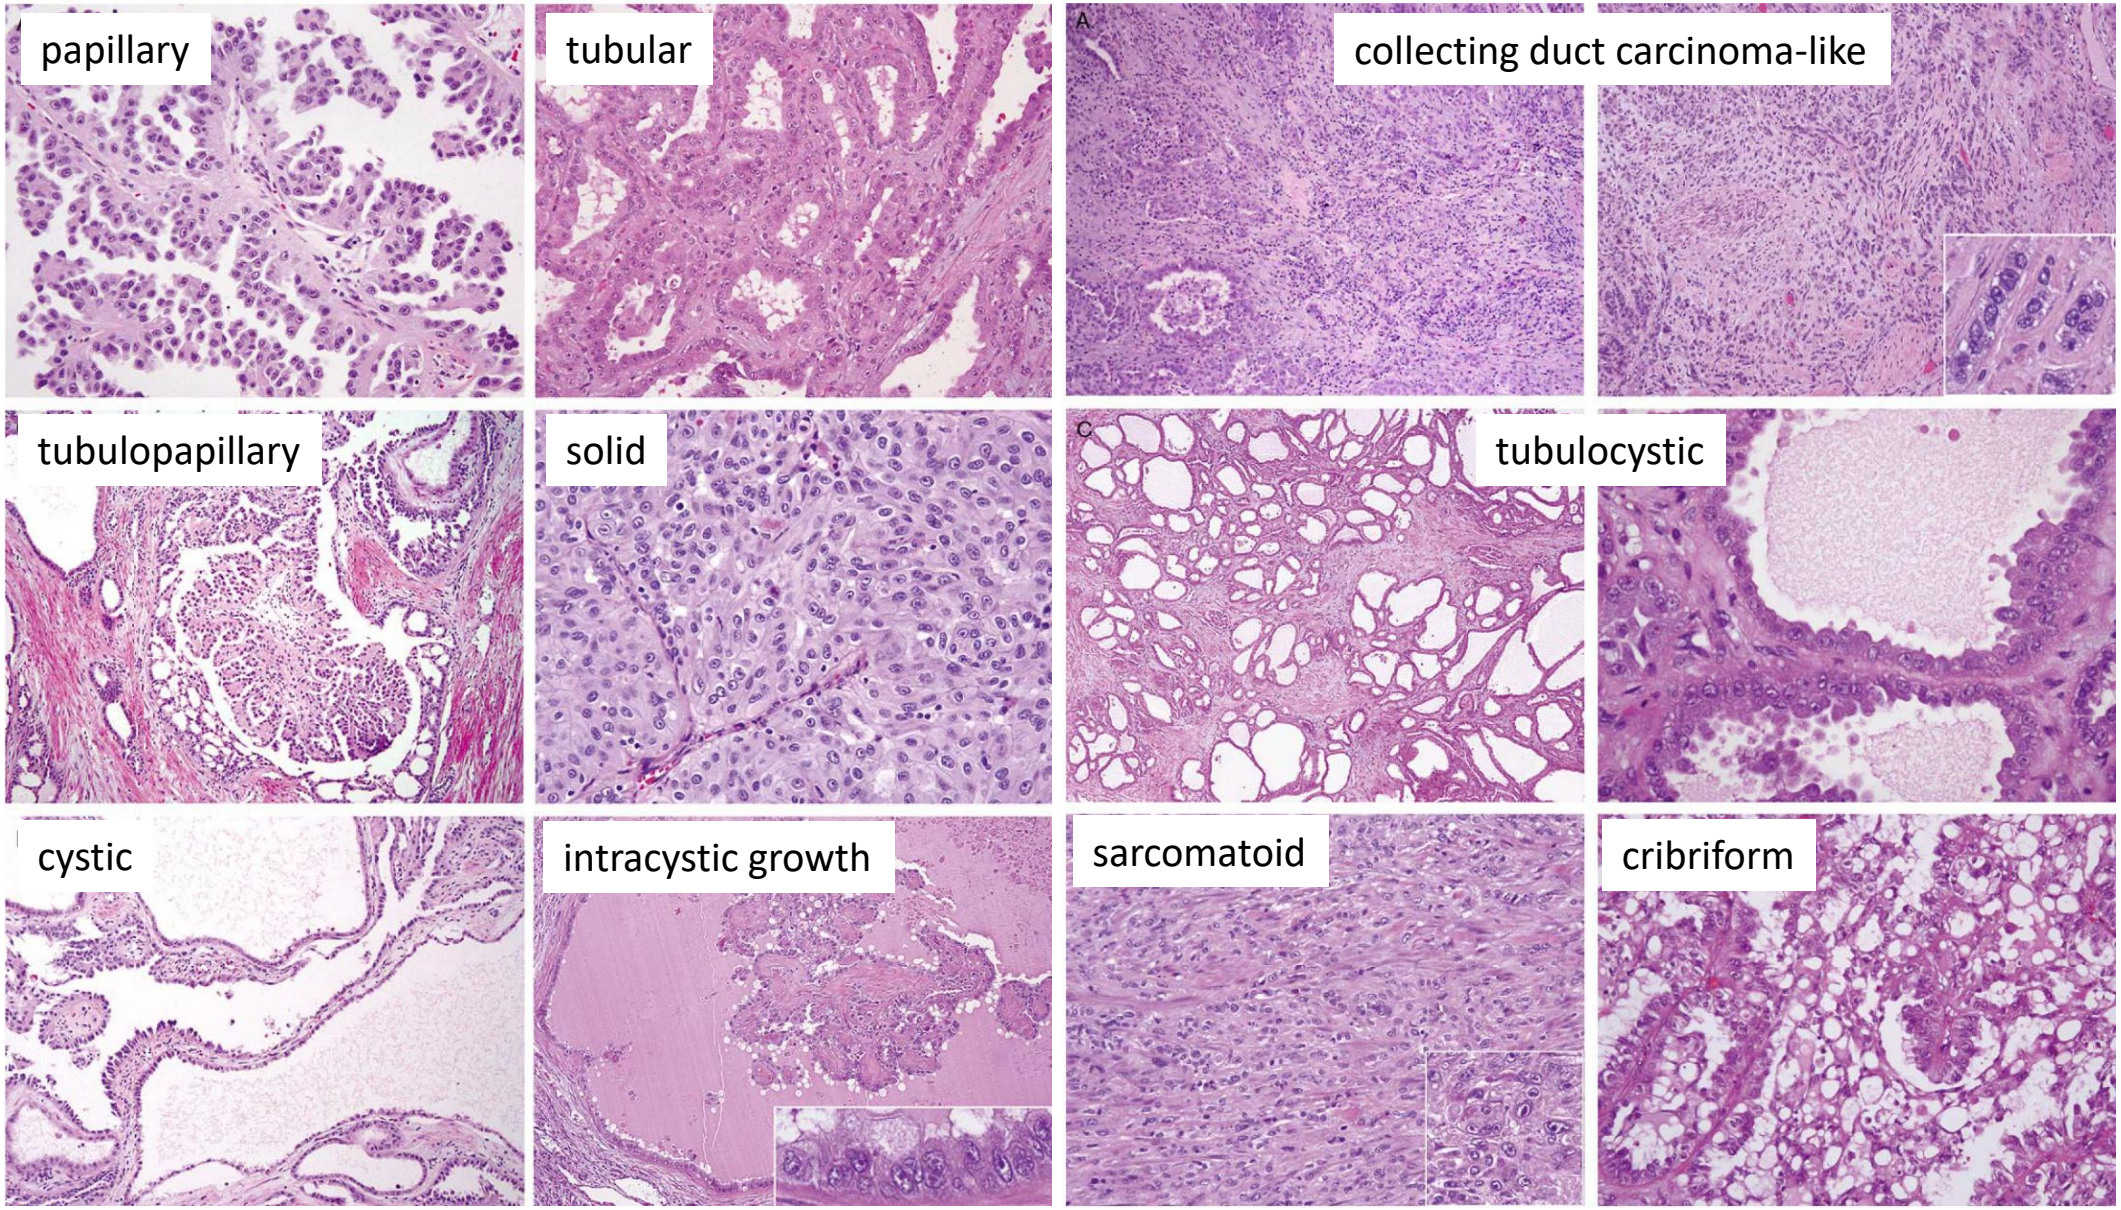
HLRCC

- **Unilateral renal tumors**:
  - Papillary/tubulopapillary/solid architecture
  - Eosinophilic cytoplasm
  - Enlarged nuclei with margination of chromatin
  - Prominent eosinophilic nucleolus surrounded by clear halo
- High stage at presentation, poor clinical outcome



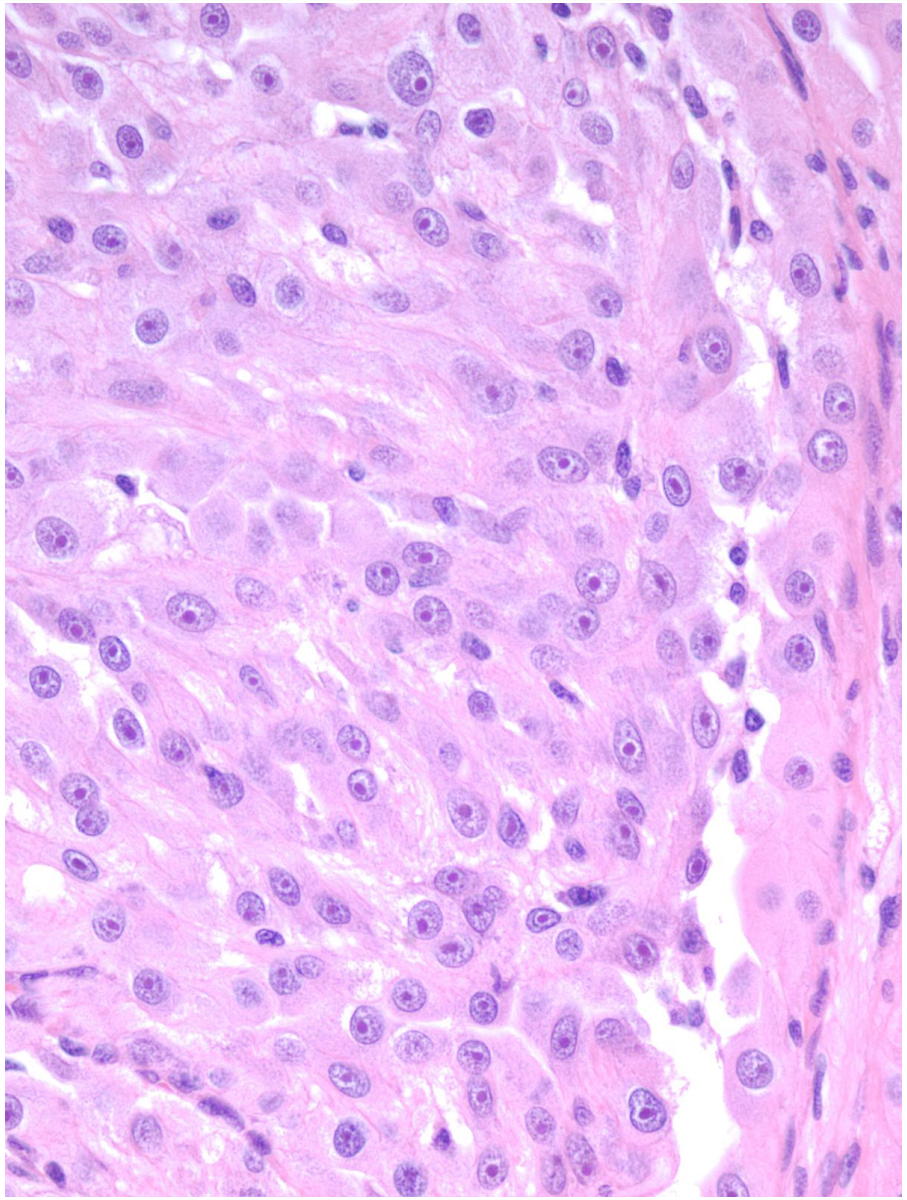
Merino et al. AJSP 2007

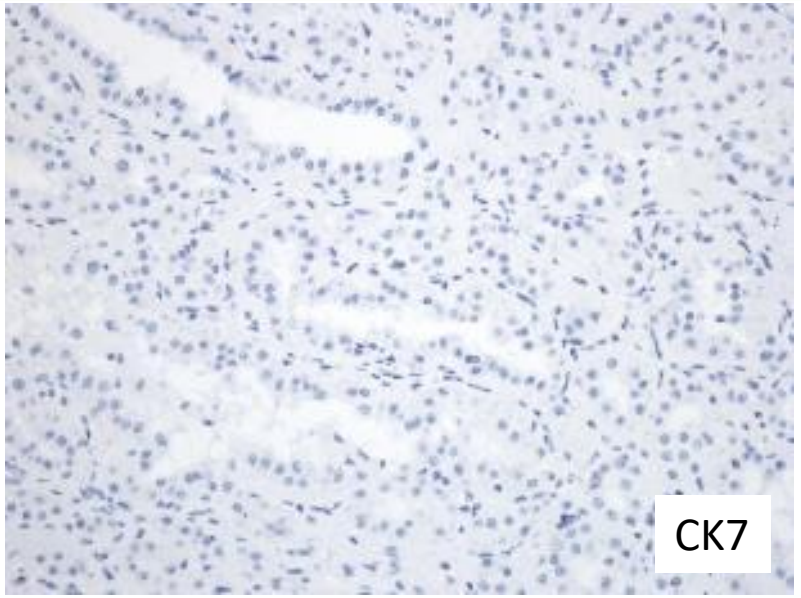
FH-deficient RCC

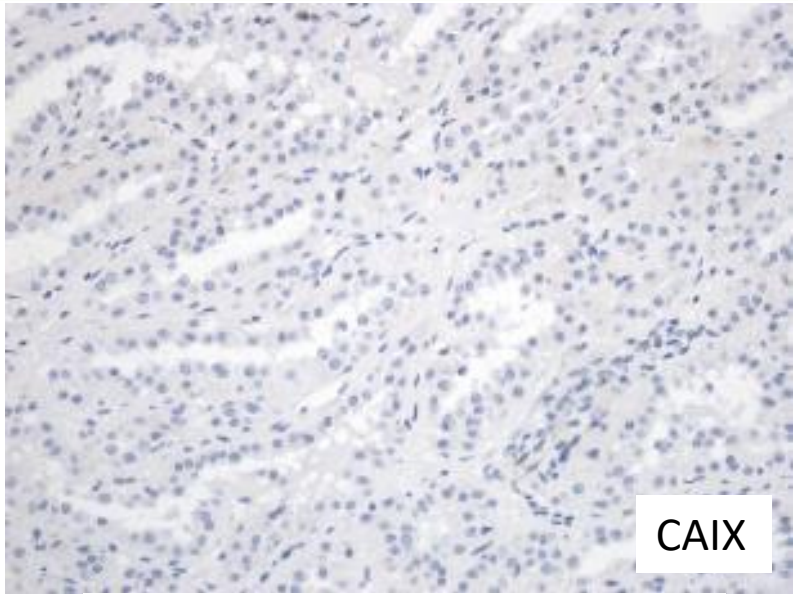


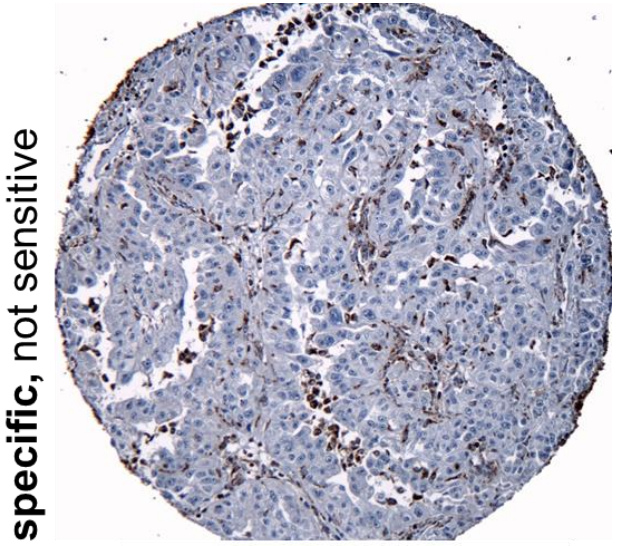
Chen YB et al. Am J Surg Pathol 2014

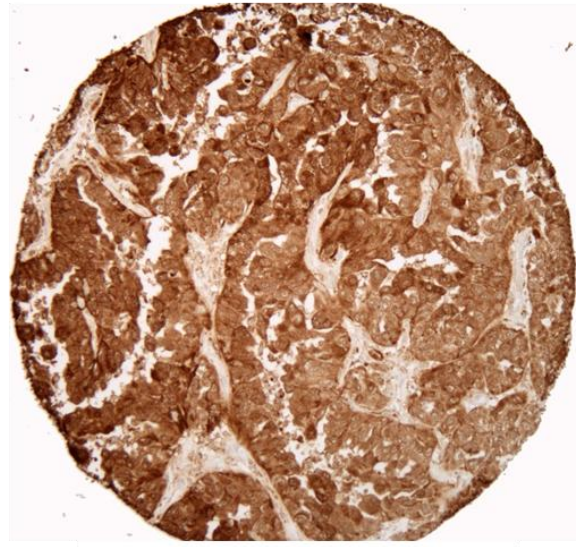
FH-DEFICIENT RENAL CELL CARCINOMA



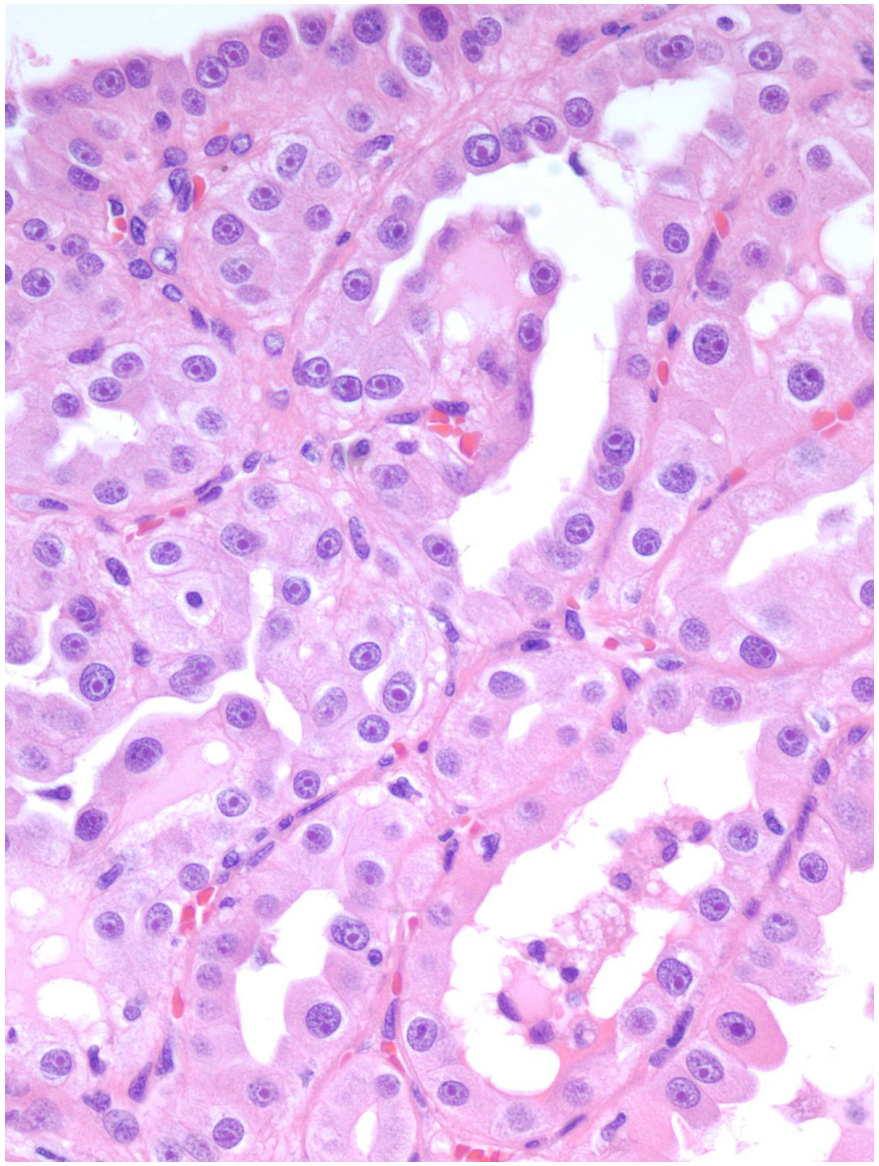


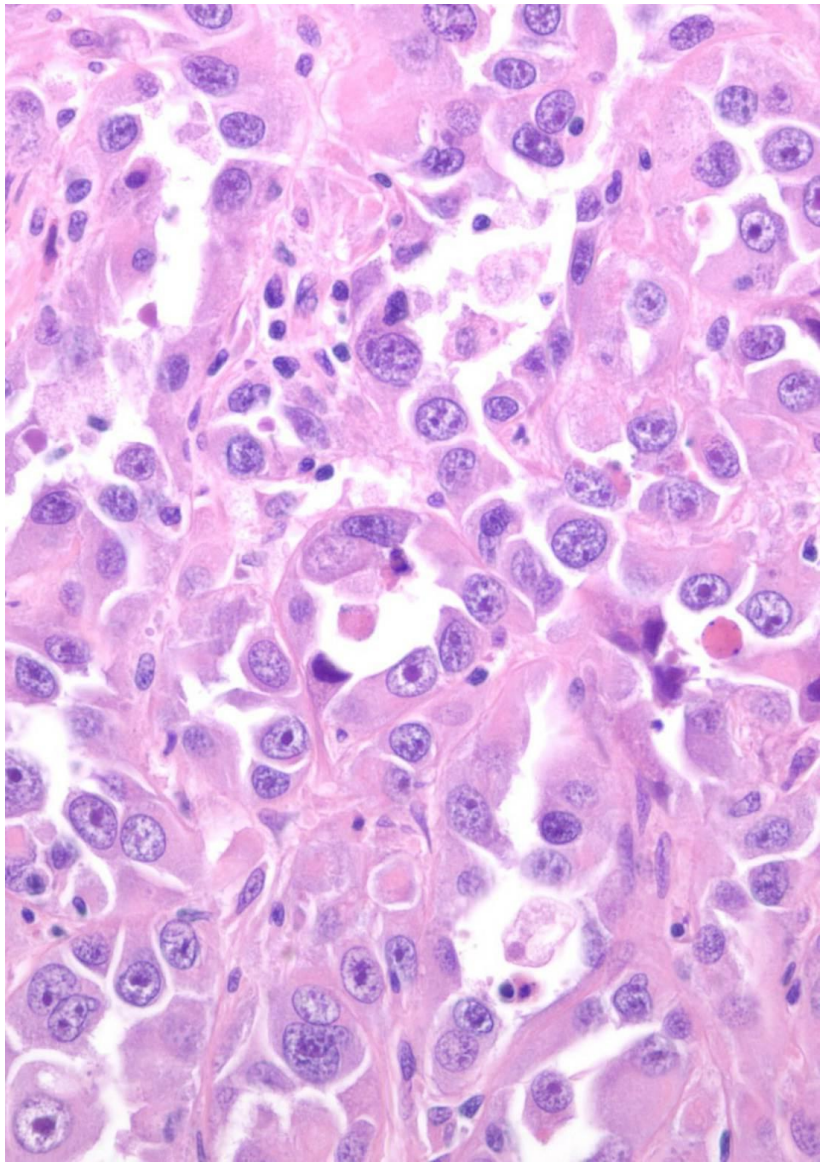


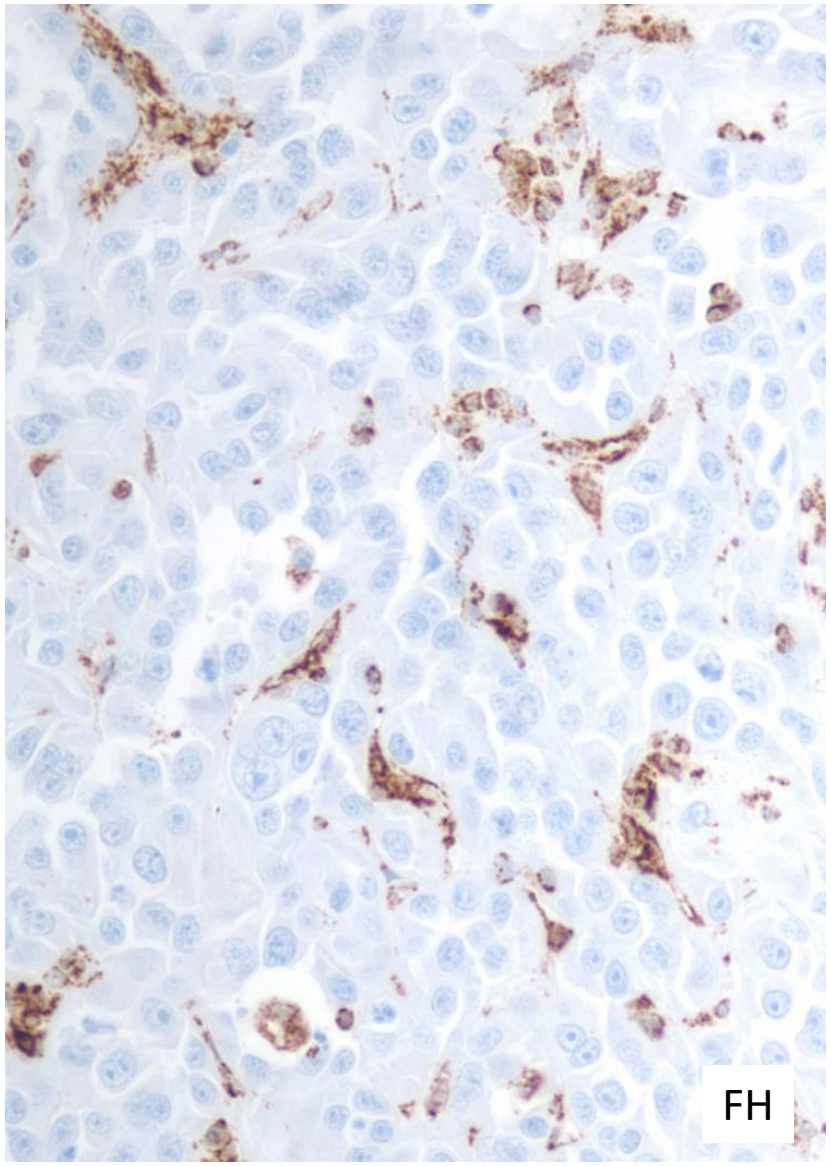




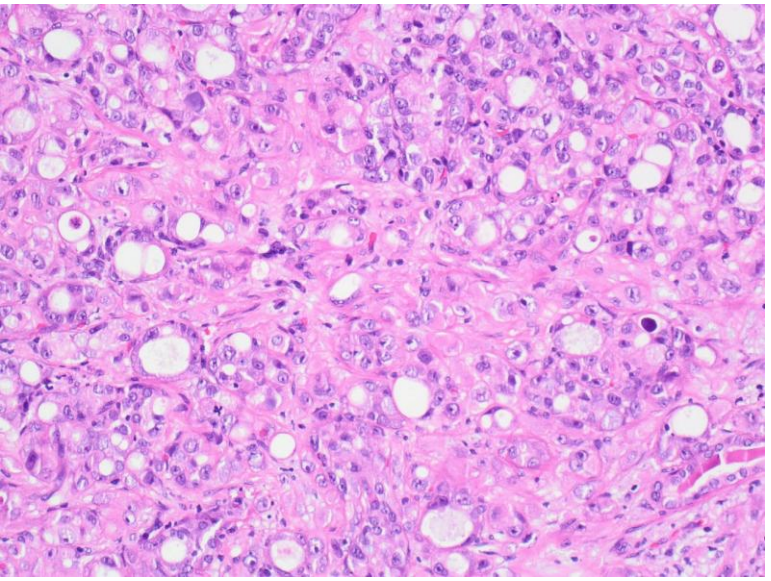
FH-DEFICIENT RENAL CELL CARCINOMA

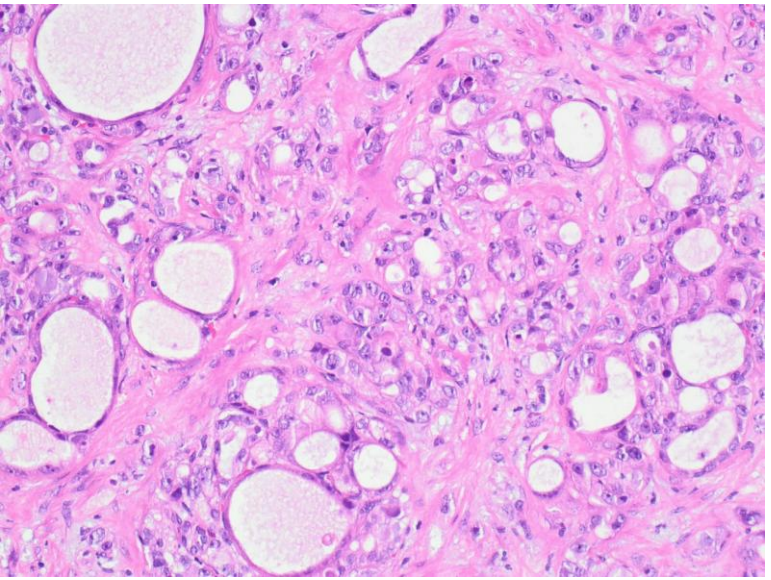


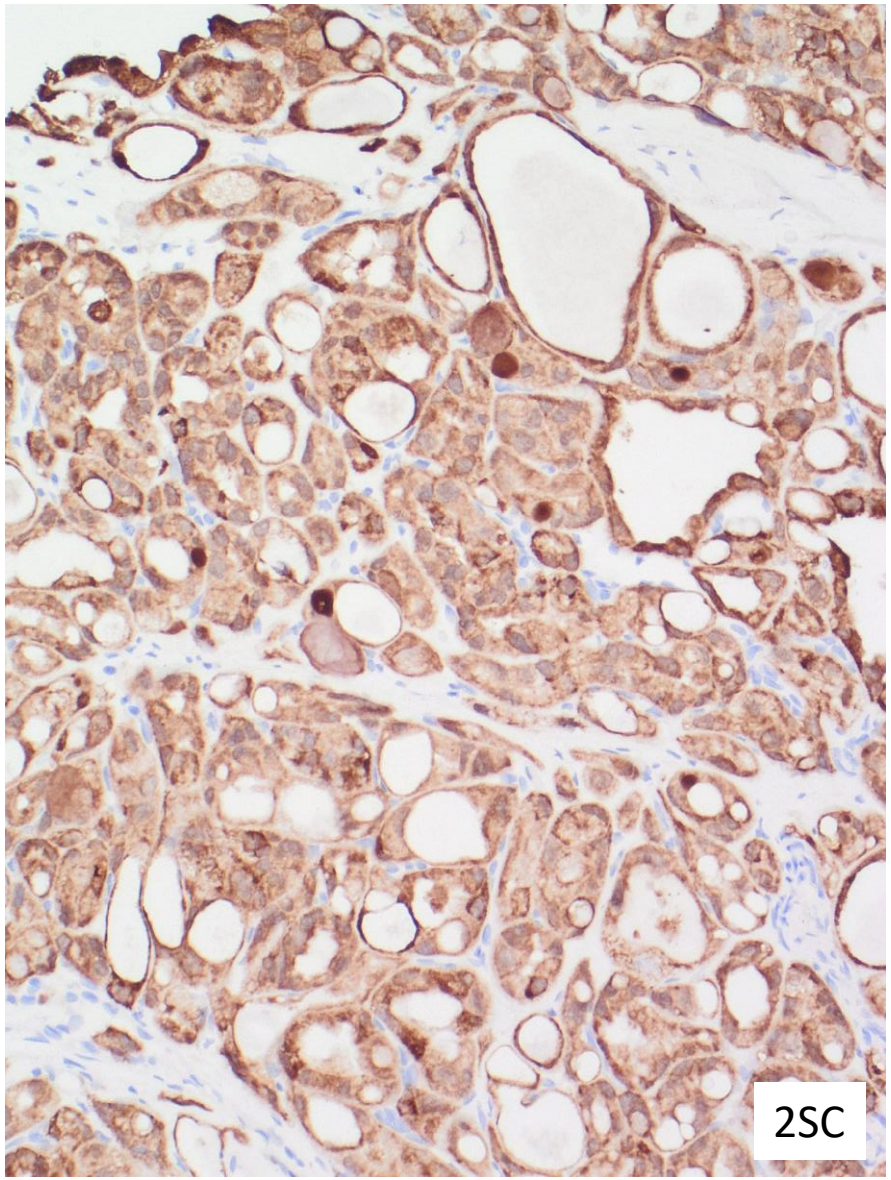


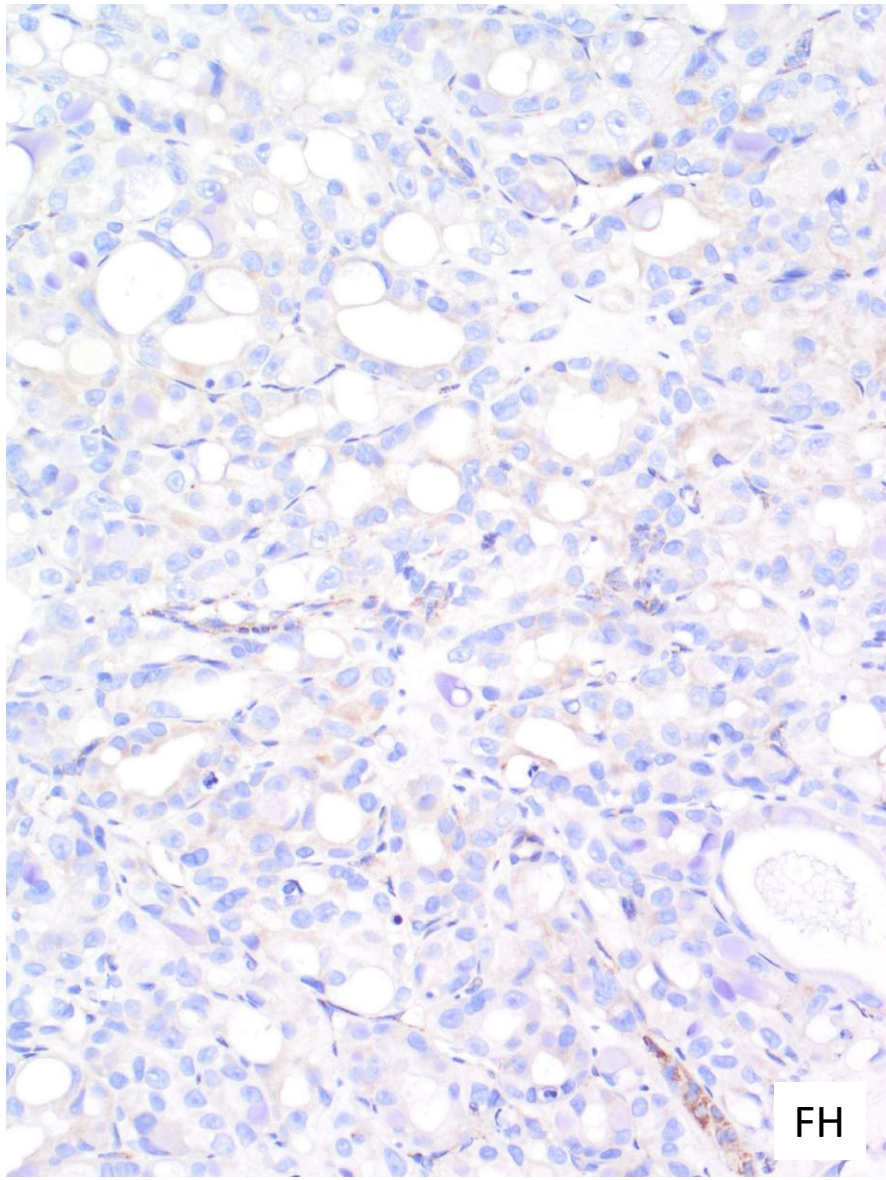


FH-DEFICIENT RENAL CELL CARCINOMA



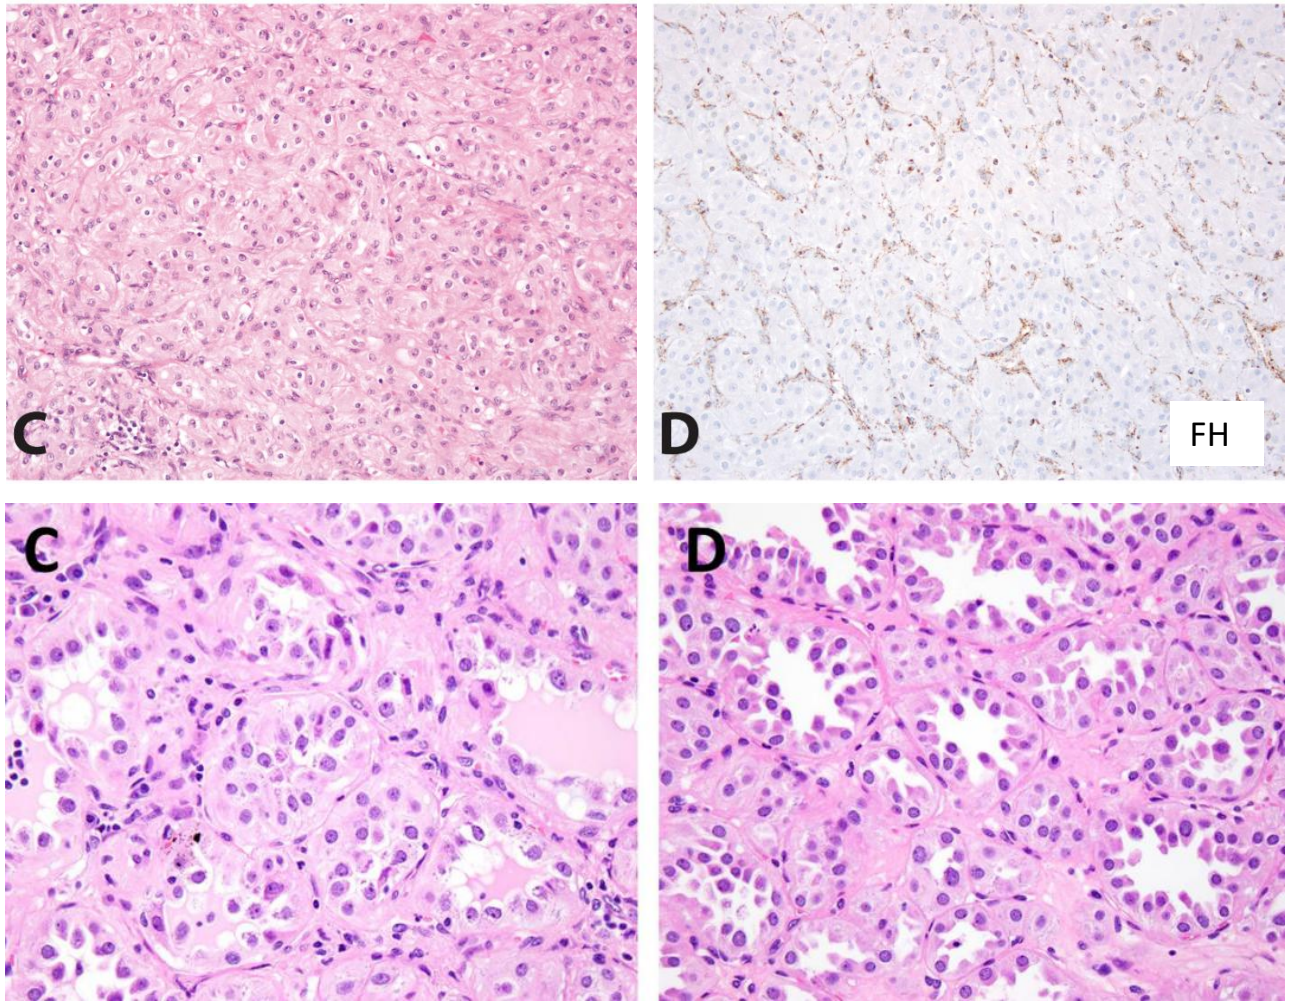






LOW-GRADE FH-DEFICIENT RENAL CELL CARCINOMA

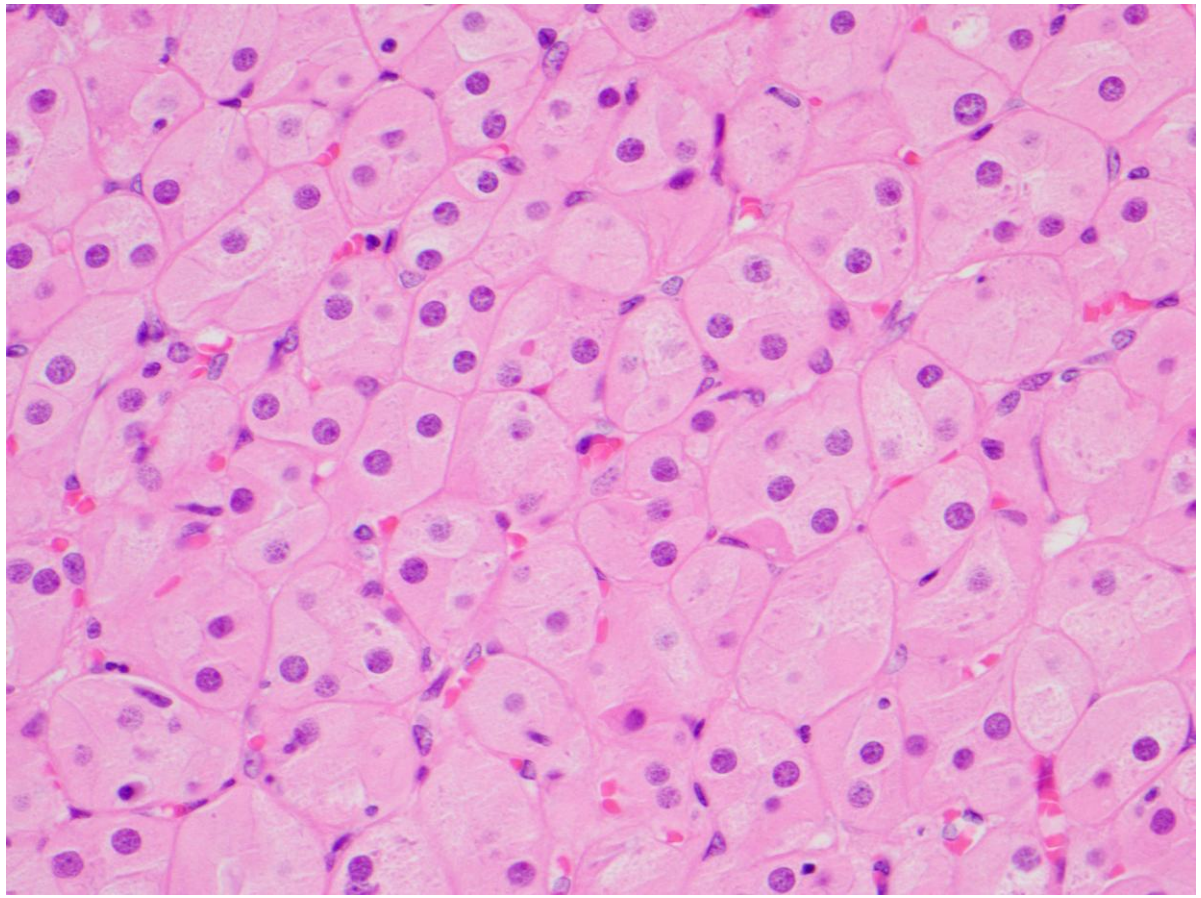
- FH-deficient RCC with low-grade oncocytic morphology
- Solid, nested/tubular architecture; uniform polygonal cells; vacuolated eosinophilic cytoplasm, scattered inclusions, fine chromatin, small nucleoli
- Differential diagnosis: SDH-deficient, ESC, LOT, EVT
- SDHB+, CK20-, CK7-
- FH-, 2SC+

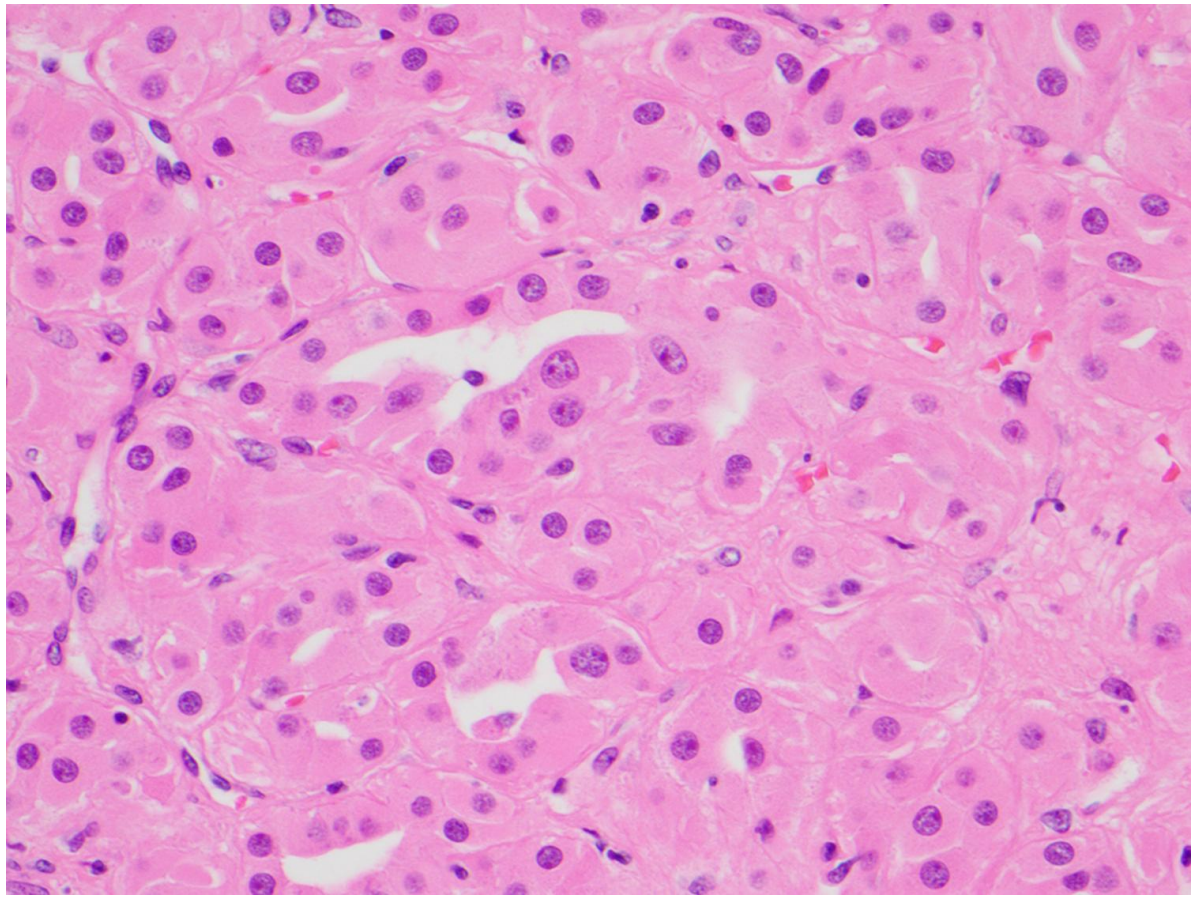


Smith et al. Histopathol 2017; Wyvekens et al. Int J Surg Pathol 2022; Hamza et al. Adv Anat Pathol 2021

LOW-GRADE FH-DEFICIENT RENAL CELL CARCINOMA

14 y/o female with renal lesion, subsequently known to have HLRCC

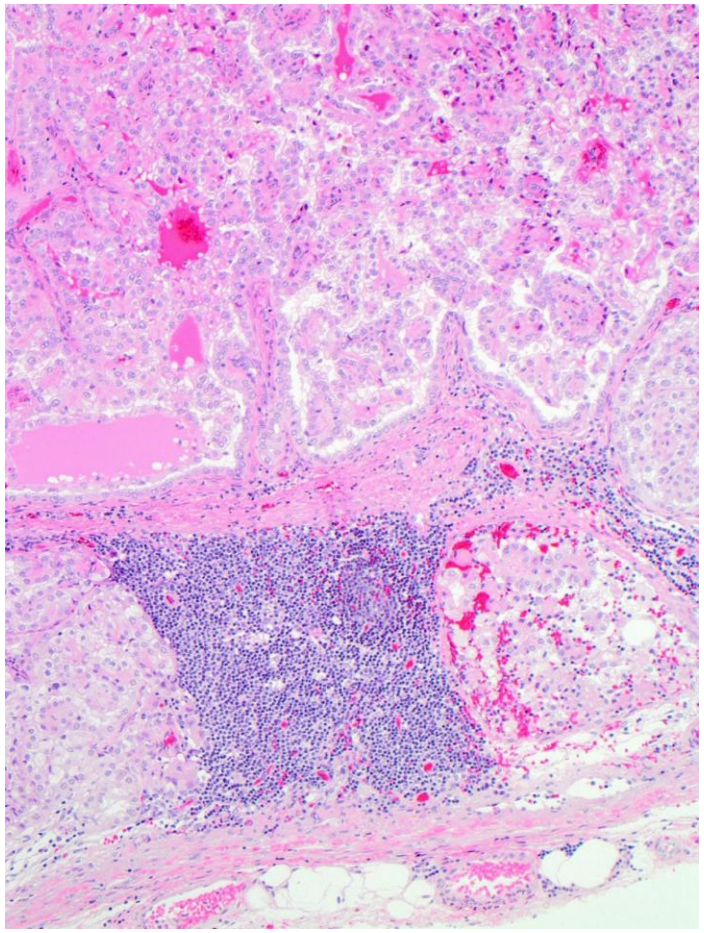


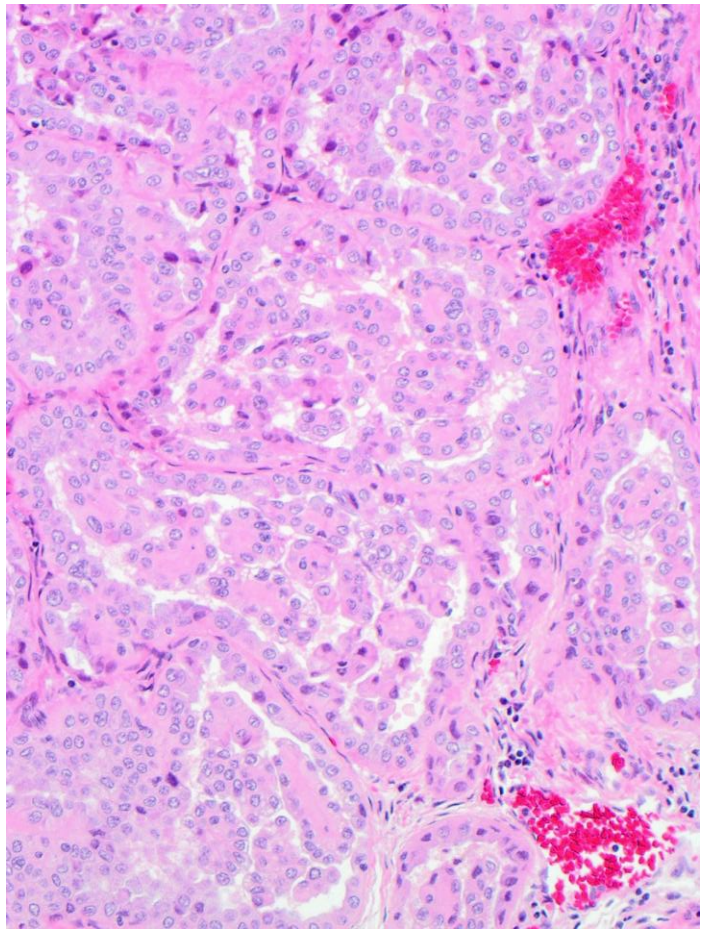


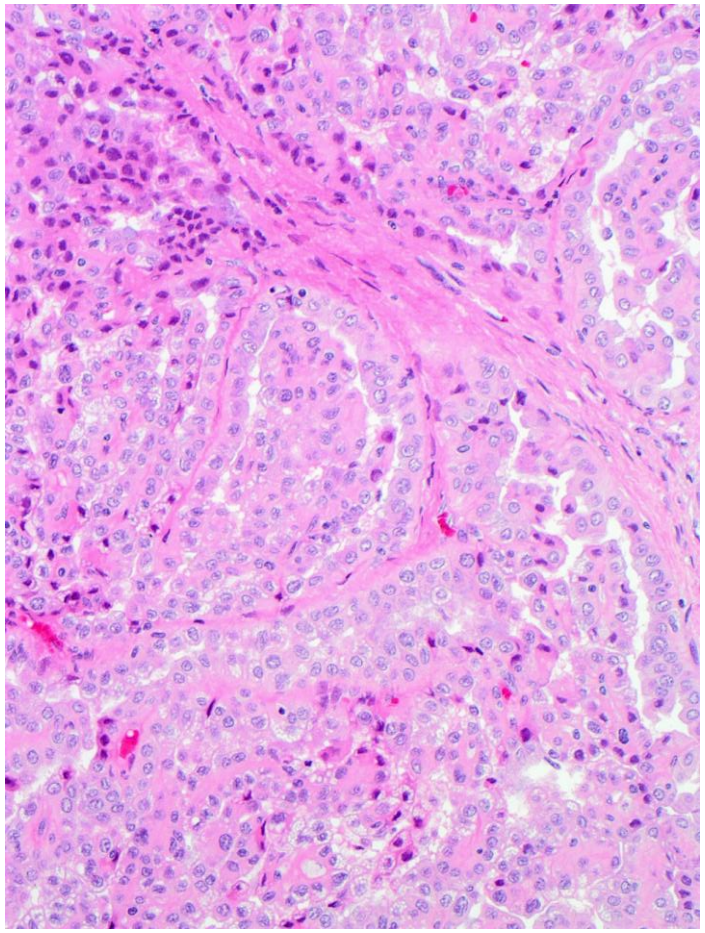
Have a low-threshold for ordering **SDHB, FH** and **2SC** IHC stains in pink renal tumors!

RENAL CELL CARCINOMA WITH PAPILLARY & SARCOMATOID FEATURES

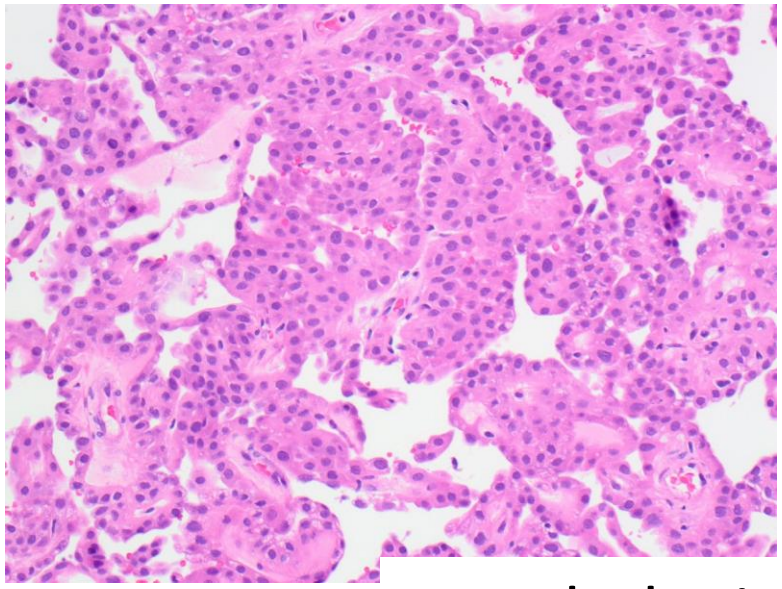
- 40 y/o female
  - H/O “papillary RCC with sarcomatoid features (4.5 cm)” in 2015 (TFE3-)
  - PET positive nodes in 2017

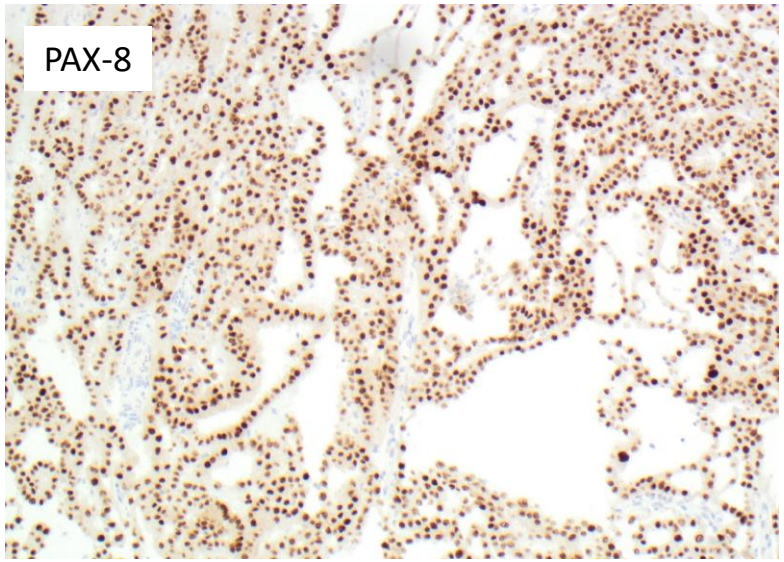




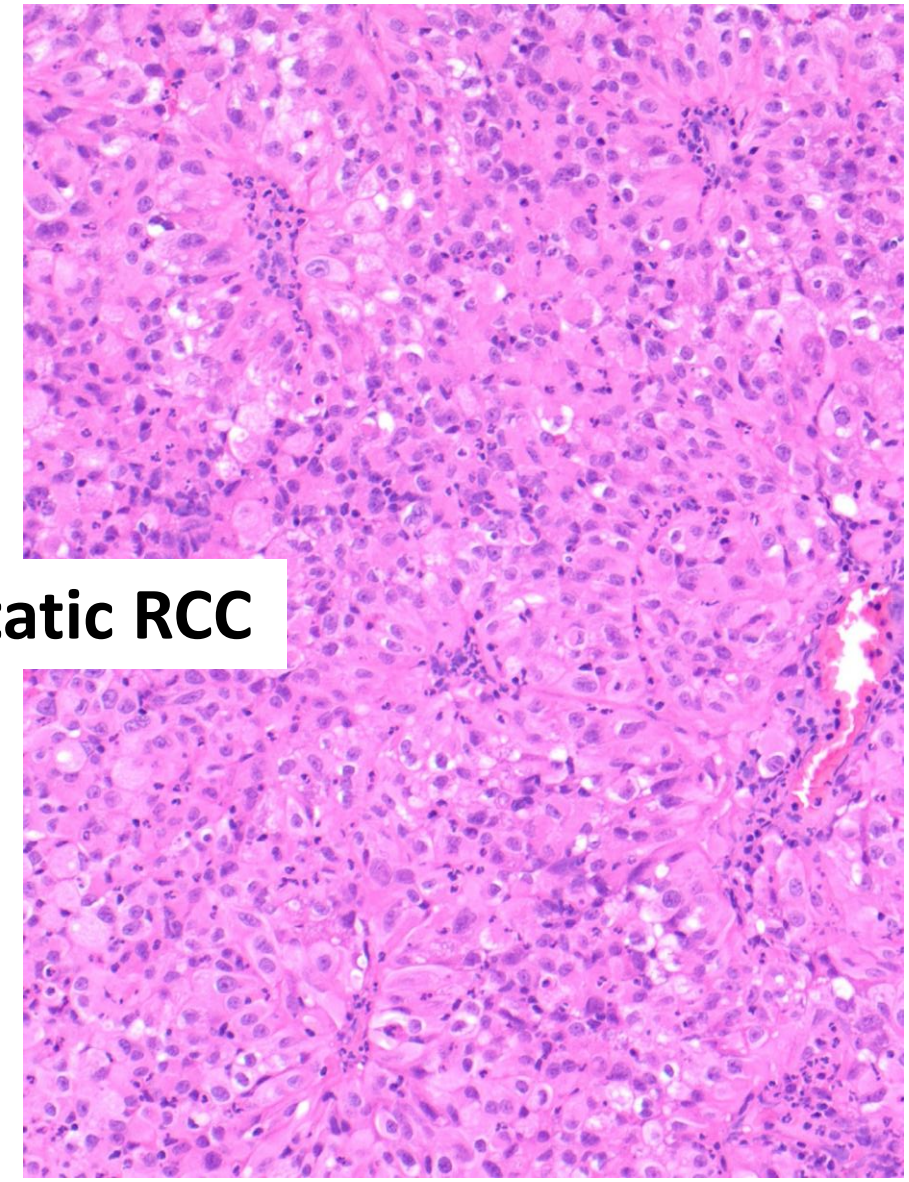


2020: Lung lesion

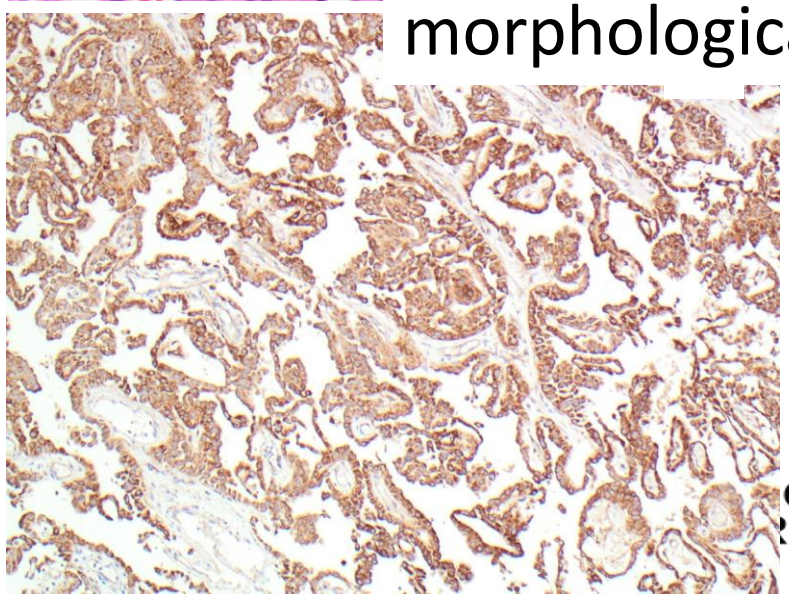


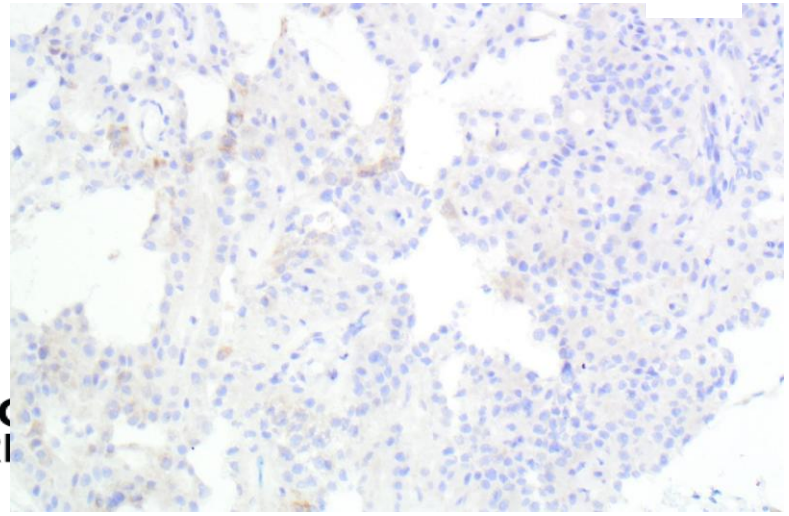


Brain lesion

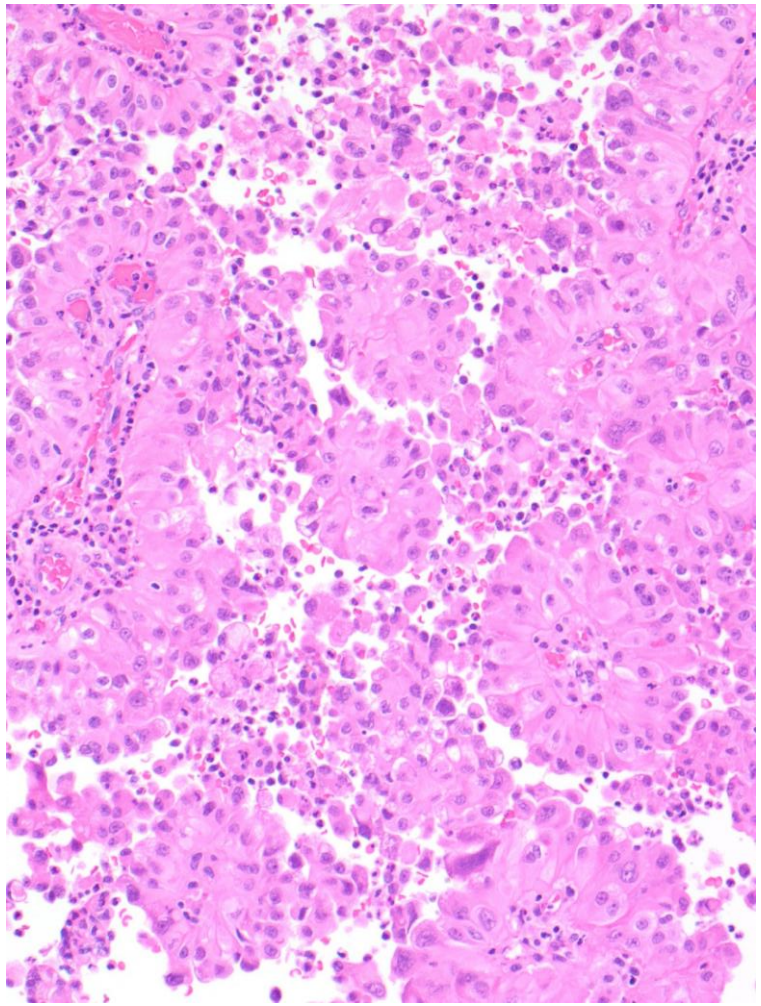


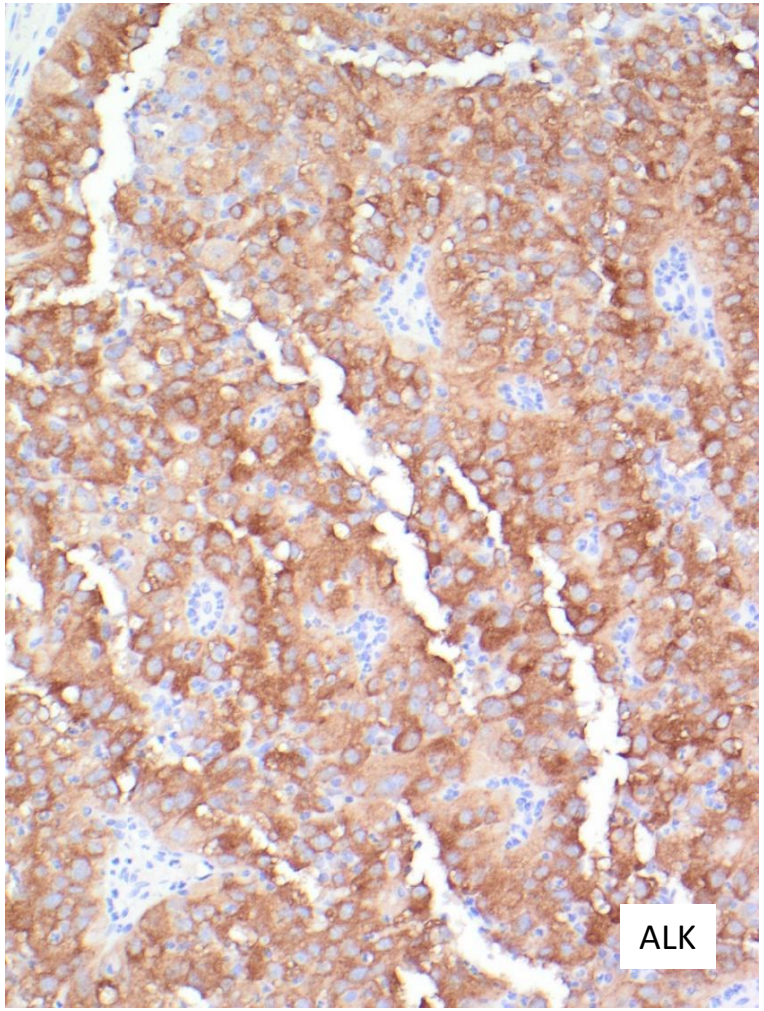
morphologically consistent with **Metastatic RCC**



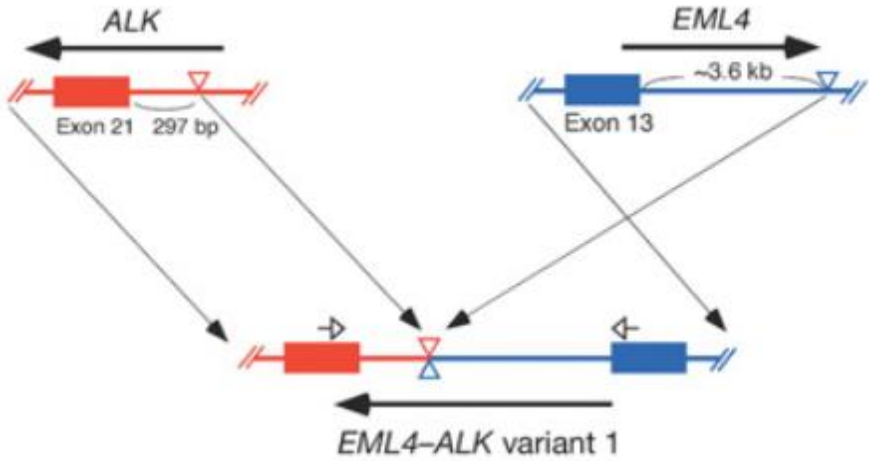


ANAPLASTIC LYMPHOMA KINASE REARRANGED RCC (ALK-RCC)





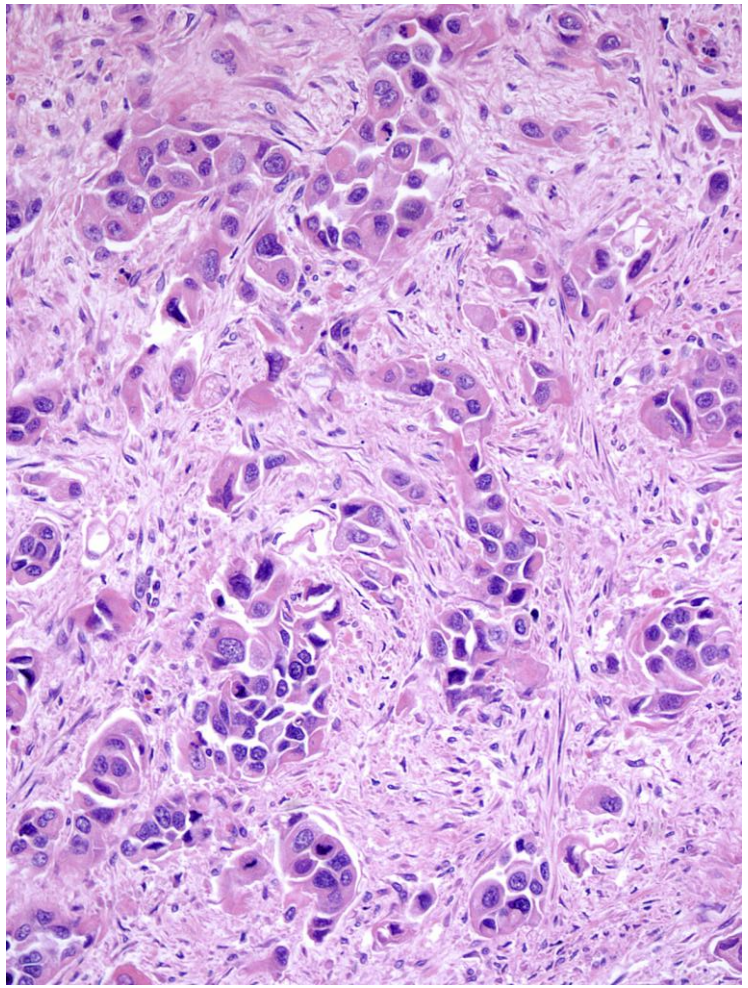
NGS: **EML4-ALK fusion**

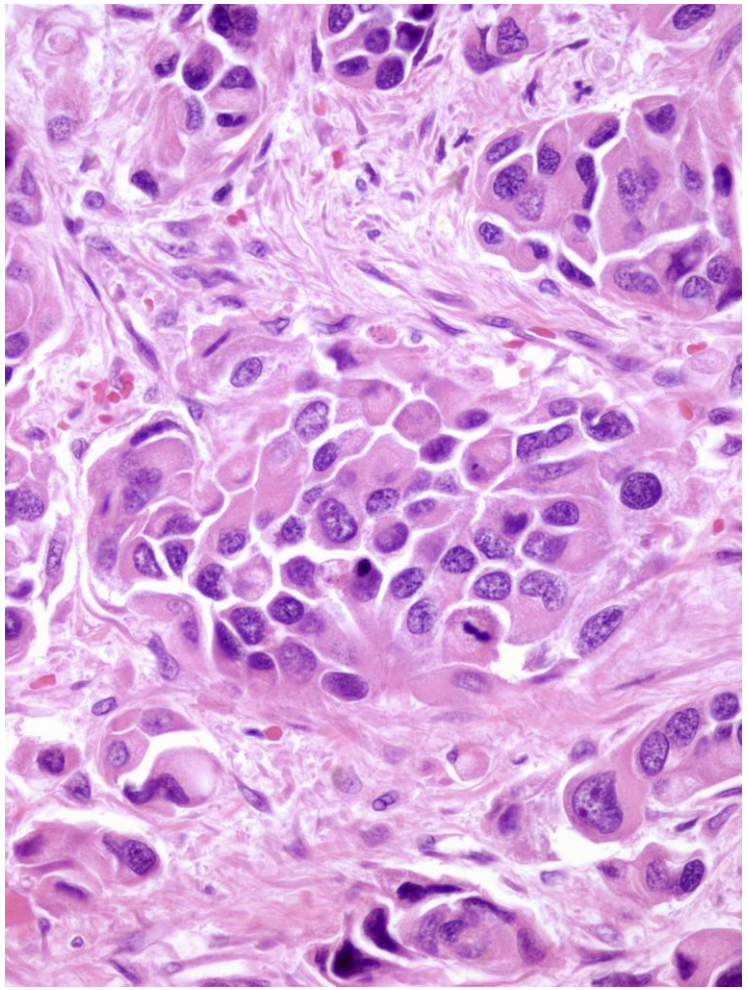


- Patient has been treated with ALK TKI
- She died few weeks later

HIGH-GRADE UPPER TRACT UROTHELIAL CARCINOMA

- May present as infiltrative mass with ambiguous histology
- Extensive involvement of renal parenchyma can resemble primary RCC
- Desmoplastic response and glandular differentiation can be seen
- Gross and microscopic examination for in situ component does not always yield results





CK7+, GATA3+, P63+

PAX8 -/+

RENAL TUMOR WITH PAPILLARY ARCHITECTURE

MEDULLARY BASED TUMORS

	Tumor type	Clinical features	Morphology	IHC	Molecular features	Prognosis
	**SMARCB1 (INI1)-deficient renal medullary carcinoma**	Patients with sickle cell trait; hematuria, flank pain, male predominance, African ancestry	Infiltrating cords, nests, microcysts, sheets, and tubules; cribriform, adenoid cystic carcinoma-like appearance; myxoid desmoplastic reaction	**SMARCB1 (INI1)- PAX8+, OCT3/4+ CK7+/- HMWCK+/-**	Inactivating genomic alterations in SMARCB1/INI1	Highly aggressive
	**Collecting duct carcinoma**	Male predominance High stage @ presentation	Tubular or tubulopapillary pattern with angulated glands; desmoplastic stromal reaction	PAX8+ HMWCK+/- CK7+/- AMACR-	Inconsistent and variable results	Aggressive behavior
	**Upper tract urothelial carcinoma (UTUC)**	Positive urine cytology; prior or concurrent history of UC elsewhere in the urinary tract	Papillary, solid architecture; enlarged nuclei; infiltrates renal parenchyma, between tubules	**CK7+, GATA3+ P63+ PAX8-/+ INI1+/-**	Chr. amplification and losses; *p53* mutations; Lynch syndrome	Aggressive behavior

Include **Melanoma, Metastatic carcinoma, Lymphoma** in your differential diagnosis!

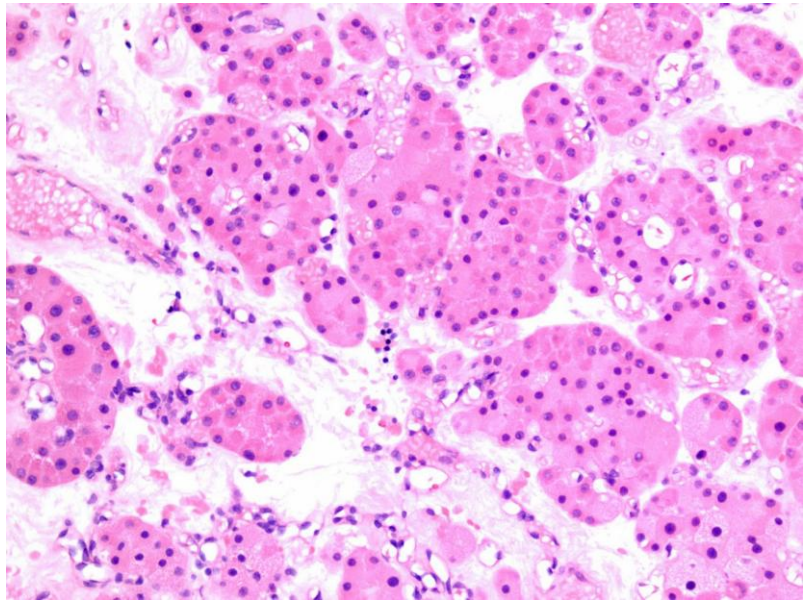
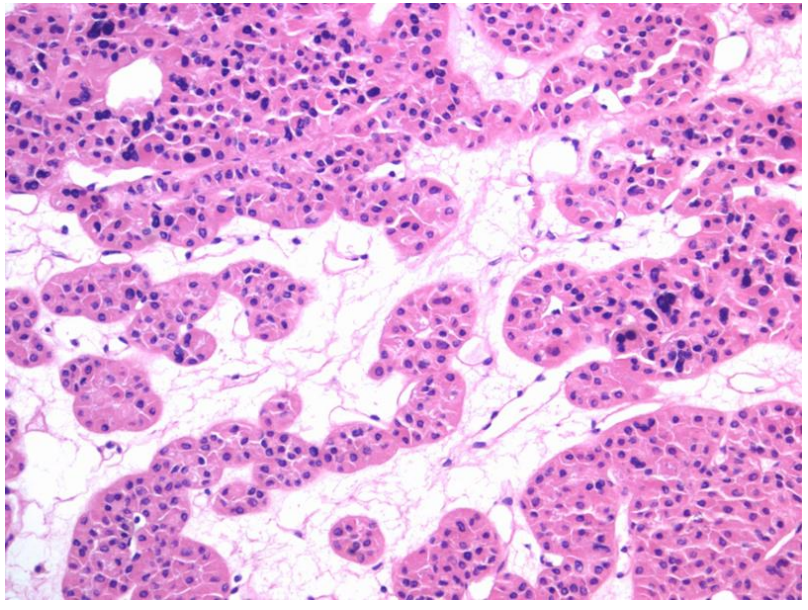
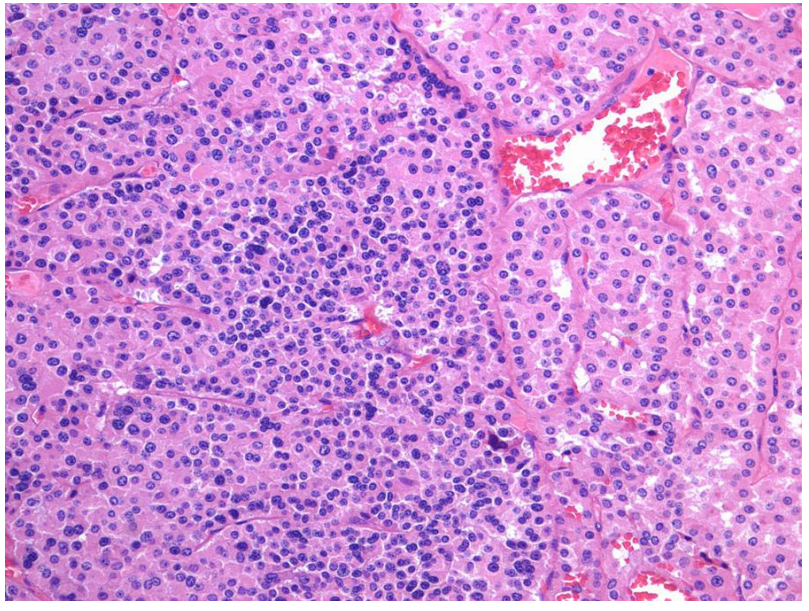
RENAL TUMORS WITH EOSINOPHILIC CYTOPLASM

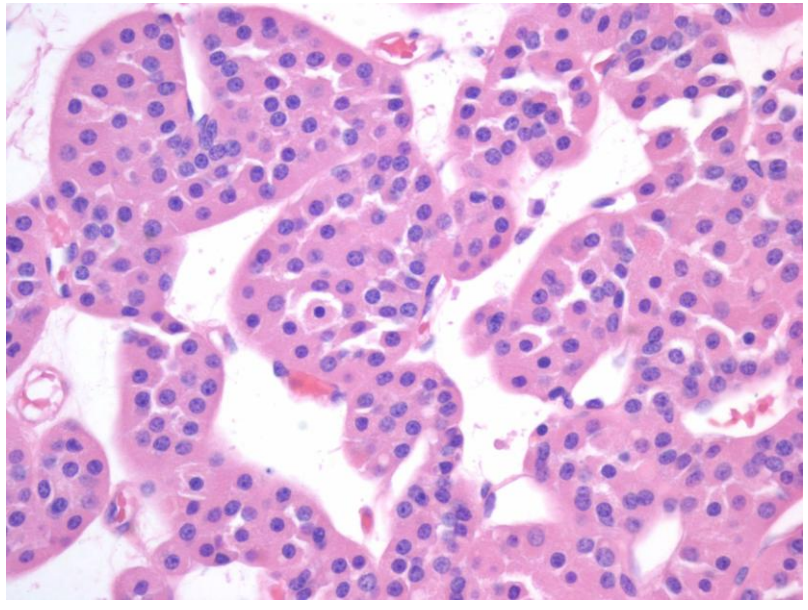
	Tumor type	Clinical features	Morphology	IHC	Molecular features	Prognosis
	**Oncocytoma**	~5% of renal neoplasms	Nests/tubules lined by cells with granular cytoplasm; myxoid/hyalinized stroma; round, regular nuclei with visible central nucleoli	**CK7-/+ (focal)** **CD117+** Vimentin-	Diploid karyotype; loss of chr. 1 & Y	Indolent behavior
	**Low-grade oncocytic tumor (LOT)**	Emerging entity	Solid and compact nests, edematous stroma, loosely arranged cells with bland round to oval nuclei, focal perinuclear halos	**CK7+** CD117- **GATA3+**	Deletions at 19p13.3, 1p36.33, 19q13.11	Indolent behavior
	**Chromophobe RCC (ChRCC)**	~10% of RCC	Abundant cytoplasm with prominent cell borders; perinuclear halos/clearing irregular, wrinkled nuclear membrane ('raisinoid')	**CK7+** **CD117+** Vimentin- GATA3-/+	Extensive chromosomal loss involving Y, 1, 2, 6, 10, 13, 17, 21	Variable behavior
	**Hybrid oncocytic tumor**	Sporadic, in renal oncocytosis, or Birt-Hogg-Dube syndrome	Cells displaying cytologic features of ChRCC and oncocytoma	CD117+ CK7-/+ Cathepsin K+/-	Intermediate between ChRCC and oncocytoma	Indolent behavior
	**Eosinophilic vacuolated tumor (EVT)**	Sporadic; rare cases reported in TSC patients	Solid growth of cells with pink cytoplasm, intracytoplasmic vacuoles and prominent nucleoli	**CK7-/+** **CD117+,** CD10+ **Cathepsin K+**	Mutations in *TSC1*, or *TSC2*, or *mTOR*	Indolent behavior

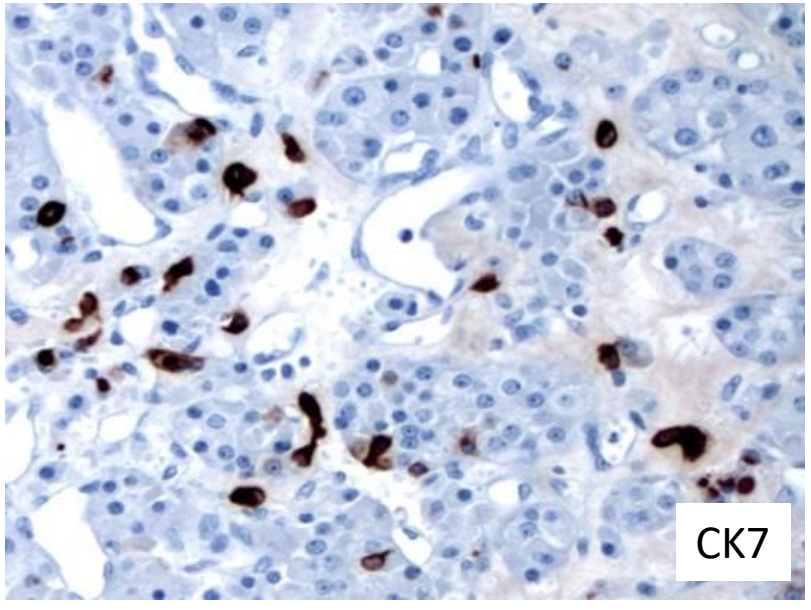
RENAL ONCOCYTOMA

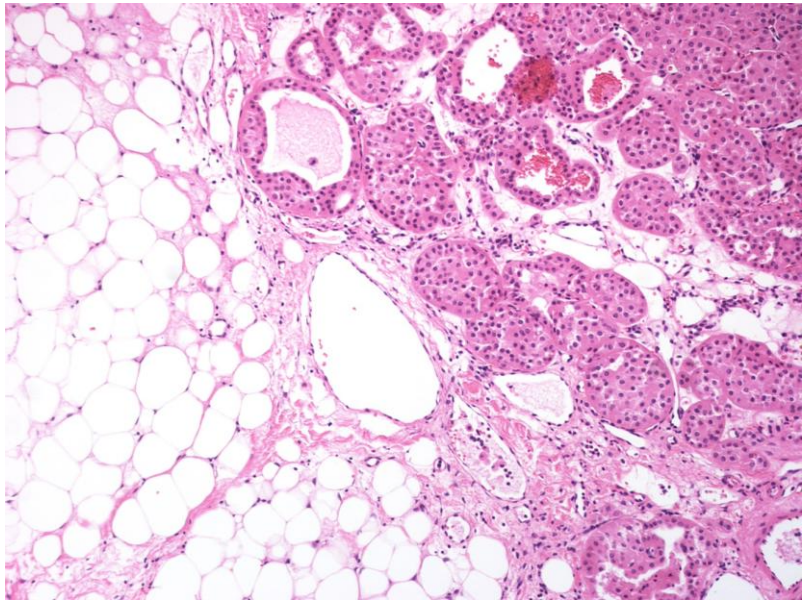




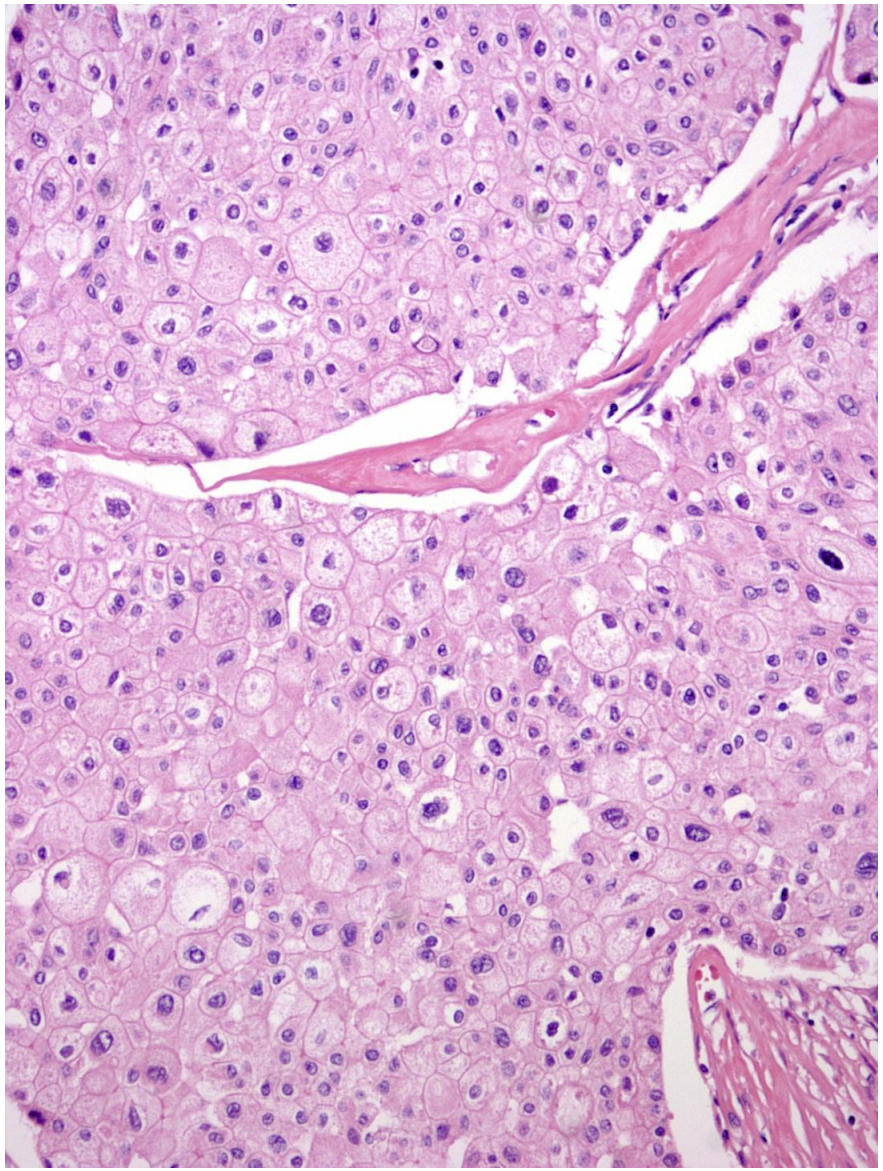


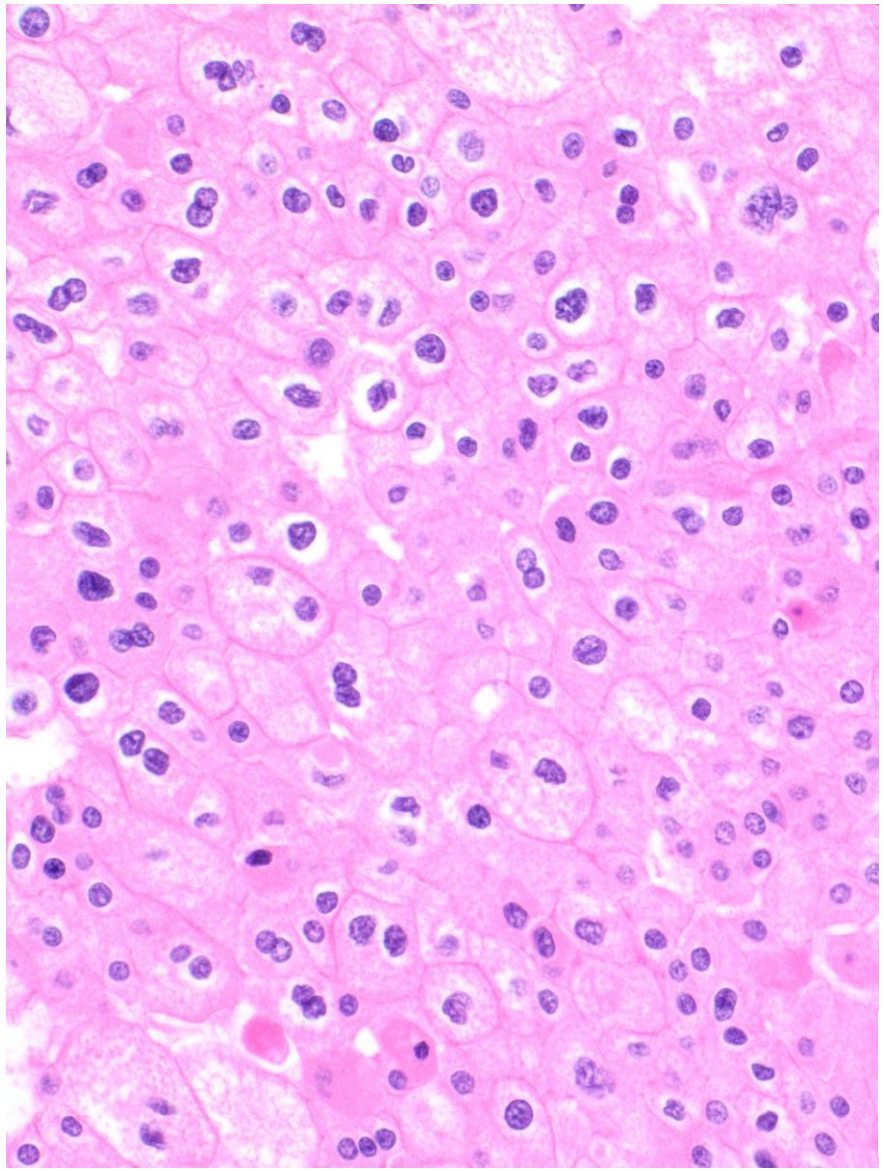


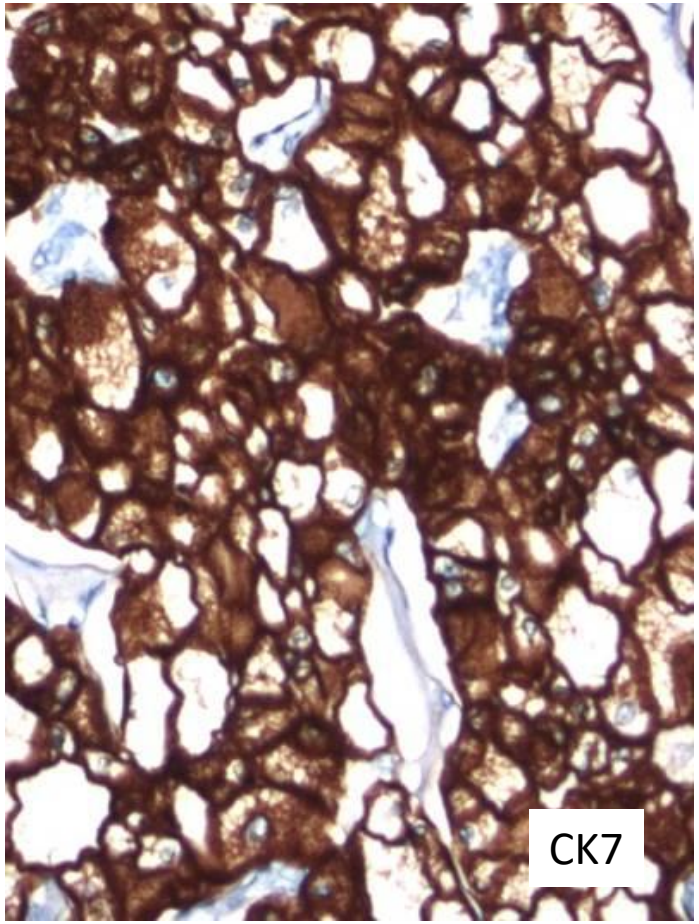




CHROMOPHOBE RENAL CELL CARCINOMA

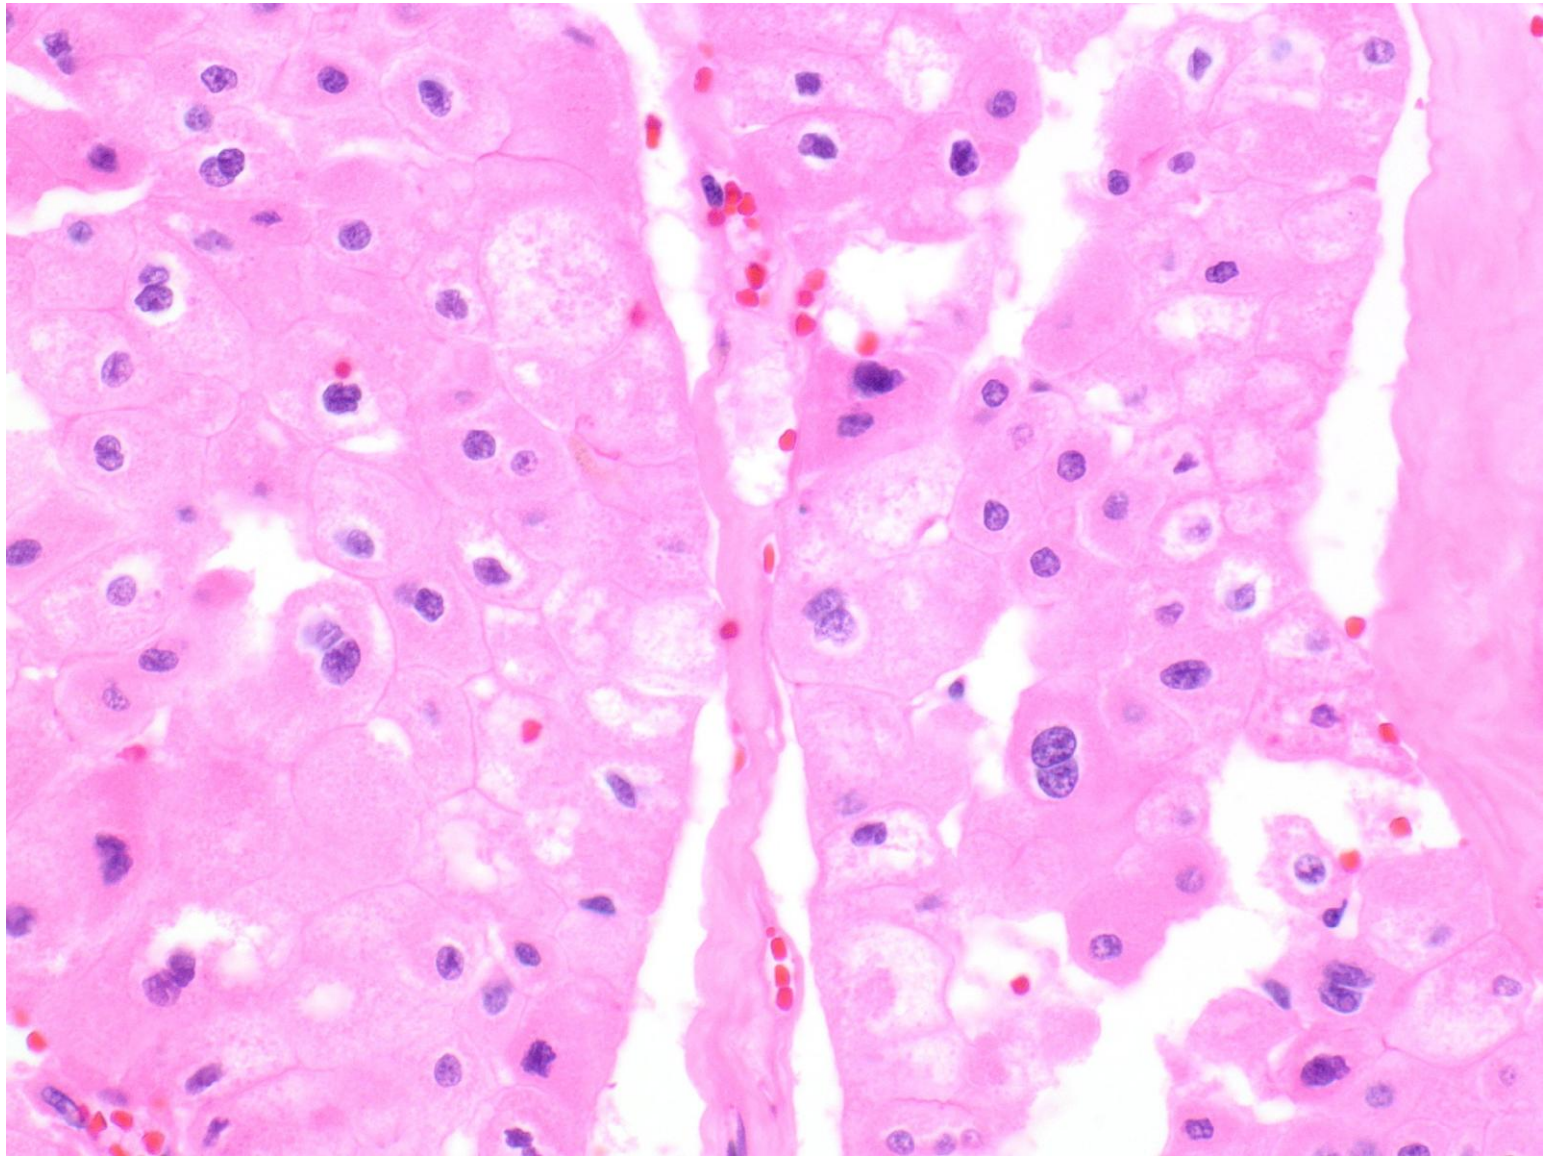






EOSINOPHILIC CHROMOPHOBE RENAL CELL CARCINOMA

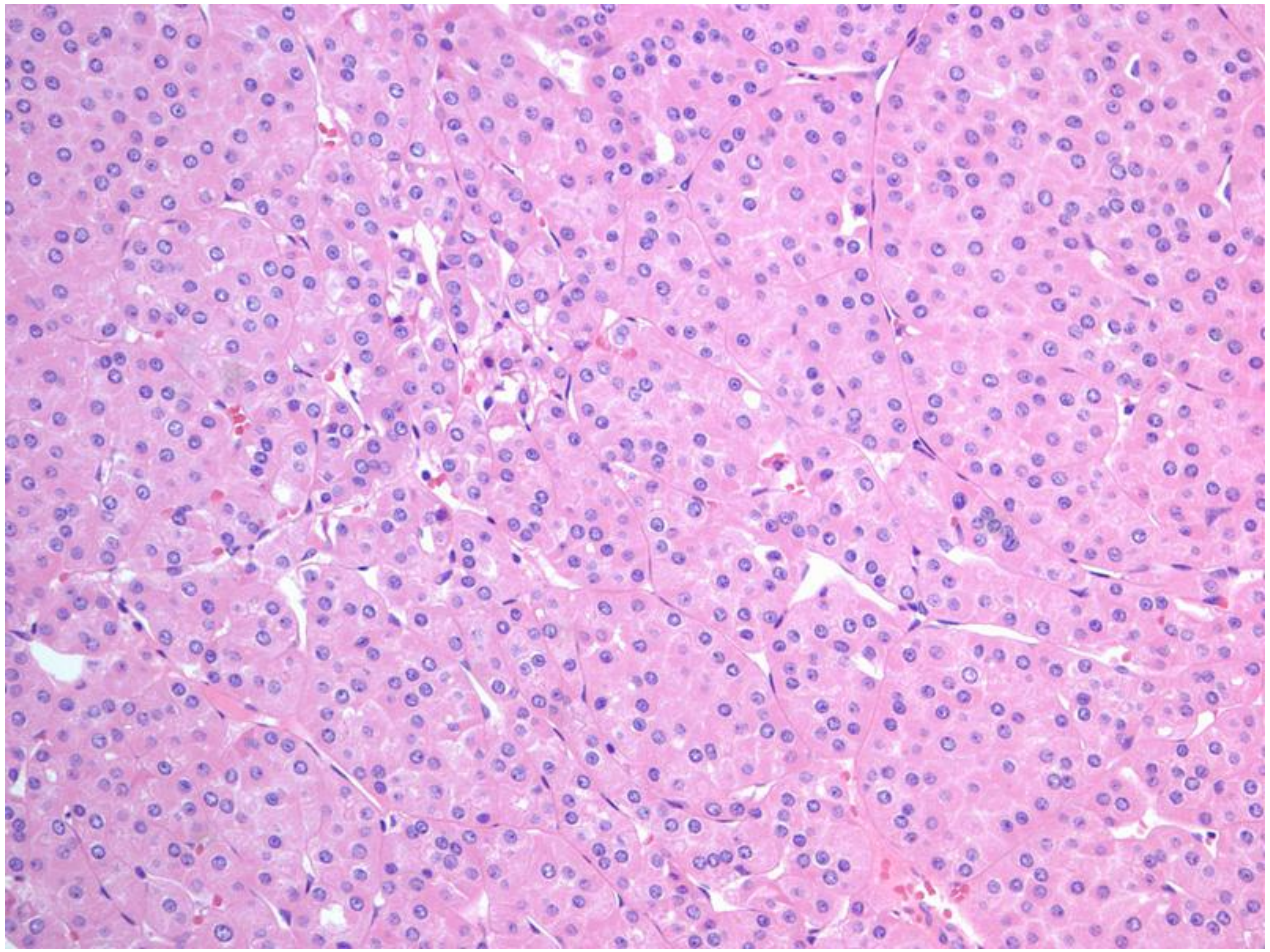
- Prominent, easily recognizable nuclear irregularities
- Diffuse eosinophilic appearance with absence of pale cells
- Lack of adverse features:
  - Necrosis
  - Sarcomatoid
  - Vascular invasion

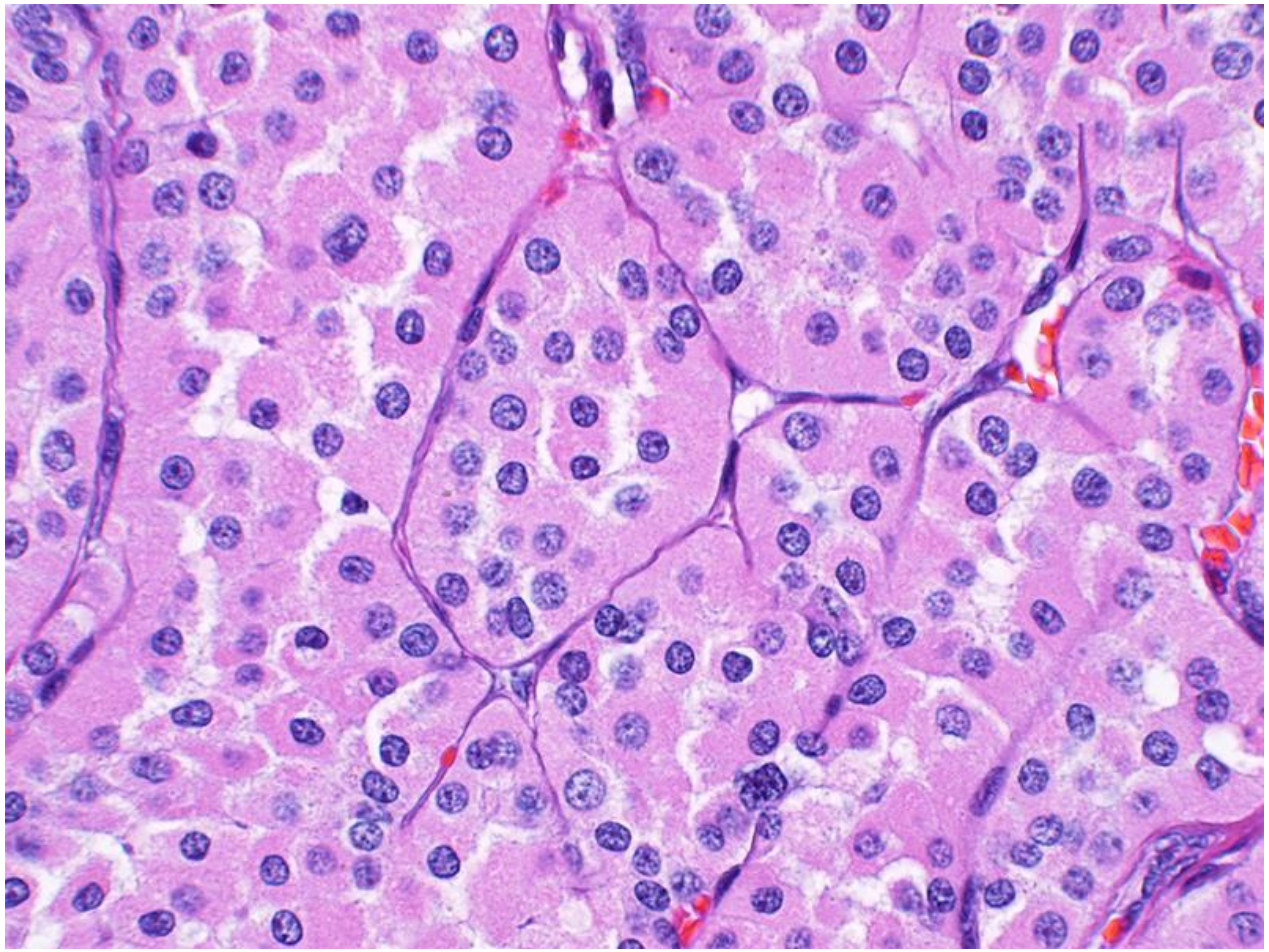


Hes & Trpkov. Mod Pathol 2022

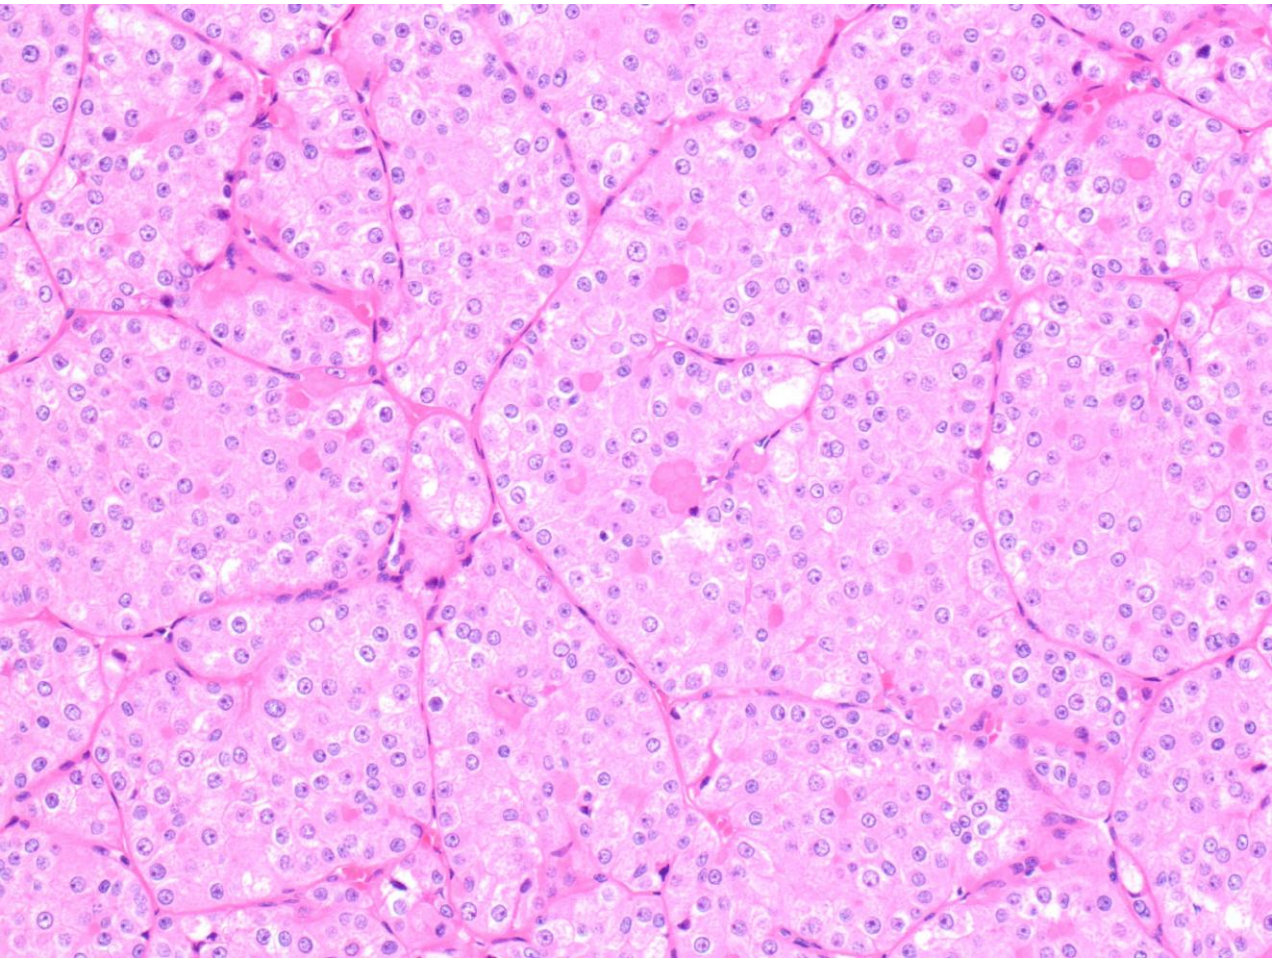
ONCOCYTIC RENAL NEOPLASMS OF LOW MALIGNANT POTENTIAL

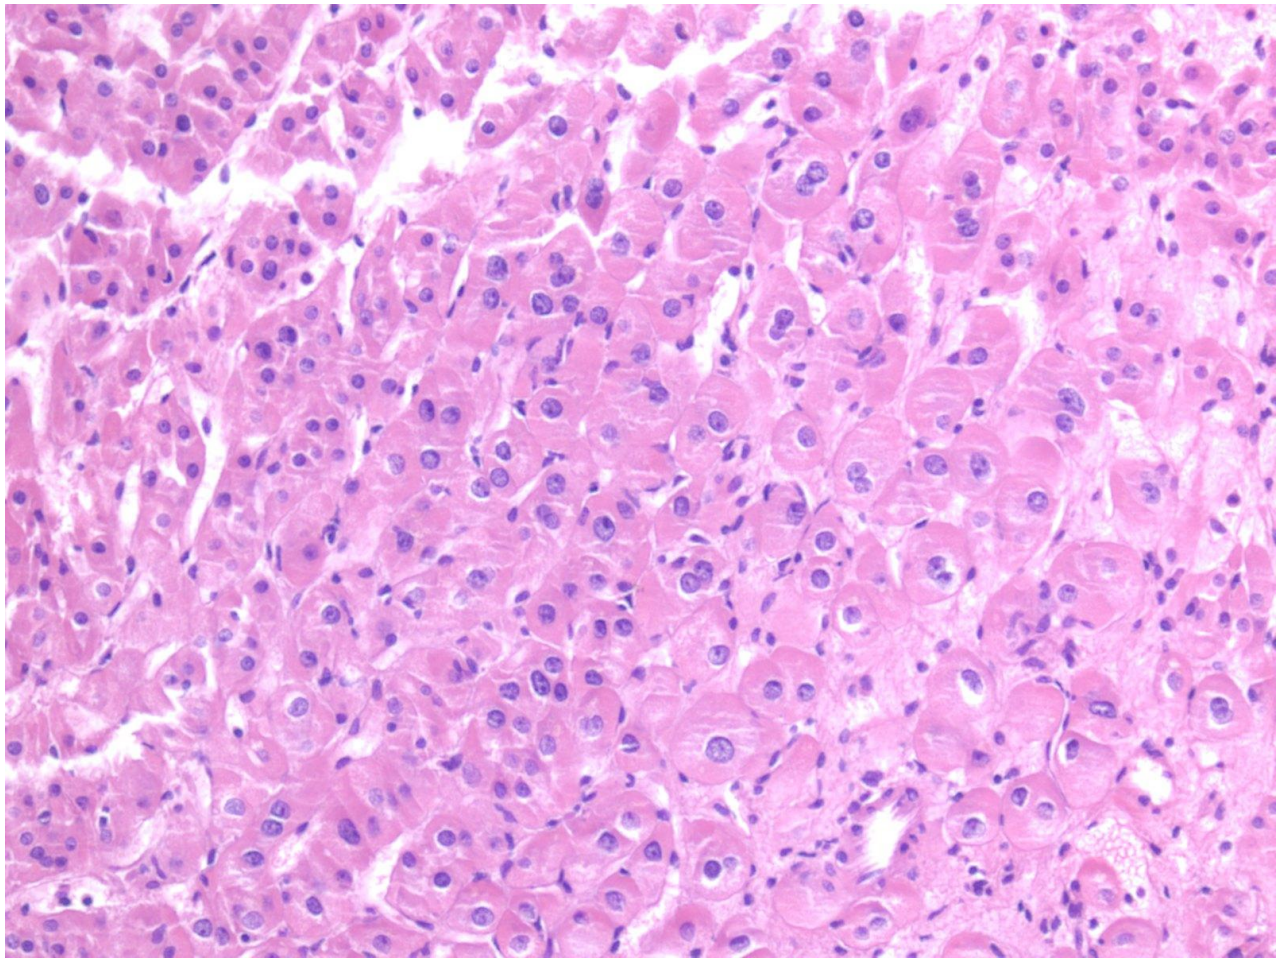
- Highly compact nested architecture, almost solid
- Variation in cell size or slight nuclear irregularity





ONCOCYTIC RENAL NEOPLASMS OF LOW MALIGNANT POTENTIAL

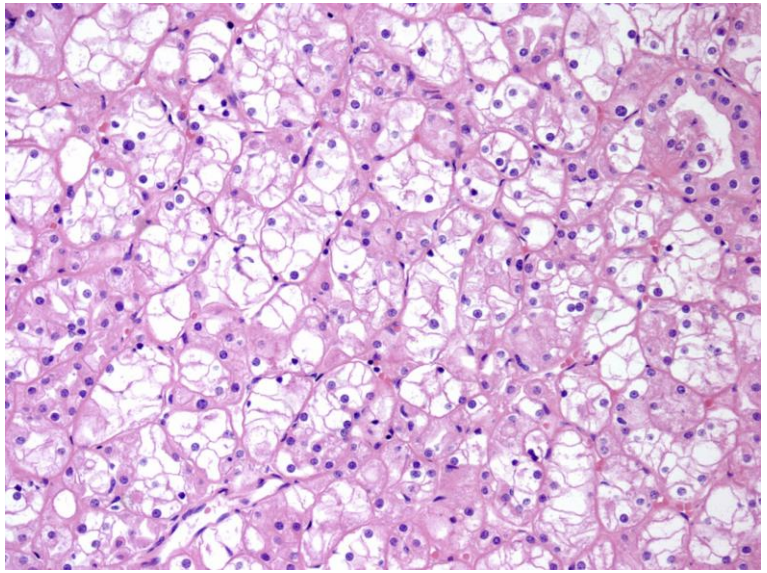


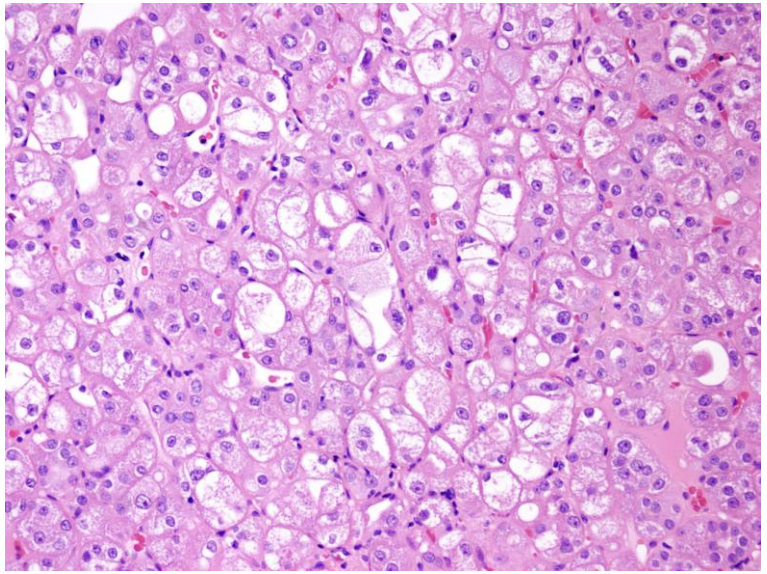


Category expressing uncertainty between oncocytoma & eosinophilic ChRCC

HYBRID ONCOCYTIC TUMORS

- Multiple and/or bilateral tumors
- Contain cells displaying cytologic features of ChRCC and oncocytoma
- Should be restricted to hereditary cases: **Birt-Hogg-Dube (BHD) syndrome** or renal oncocytosis
- Hybrid tumors may preclude a definitive diagnosis of oncocytoma on needle core biopsy
- CK patchy +; cathepsin K +

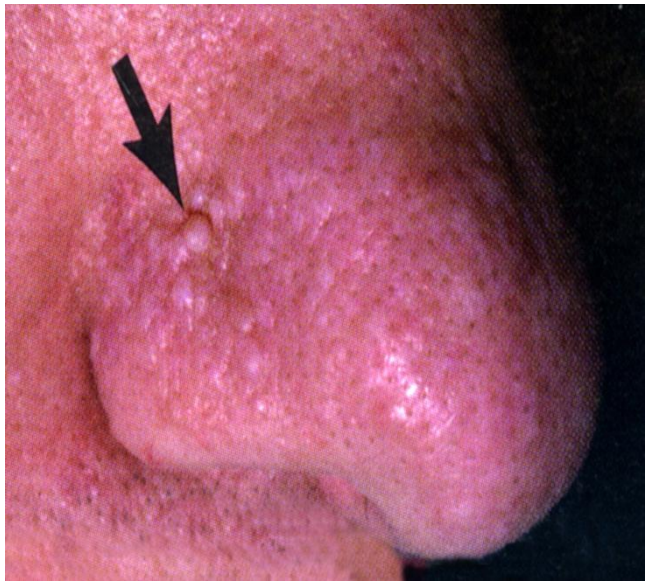


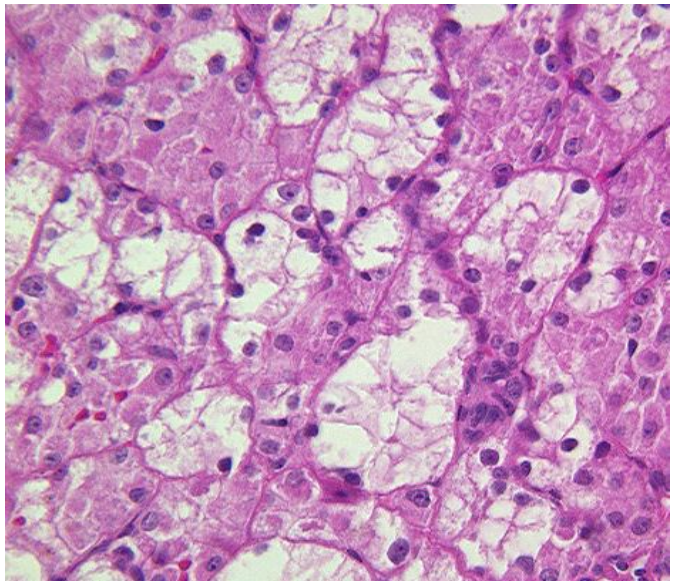


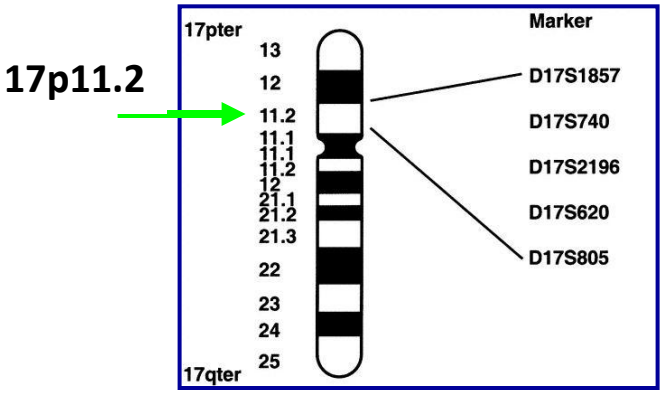
Trpkov et al. Mod Pathol 2021

BIRT-HOGG-DUBE SYNDROME

- Aut. Dom. genodermatosis:
  - small dome-shaped papules on face, neck, trunk (fibrofolliculomas)
  - higher risk of renal tumors, lung cysts, spontaneous pneumothorax
- Male predominance
- Mean of 5.3 renal tumors/patient
- Multiple (77%), bilateral (60%) tumors







Hybrid tumors
Eos. ChRCC
Oncocytoma
Eos. Papillary
Clear cell RCC

Pulmonary cysts

RENAL TUMORS WITH EOSINOPHILIC CYTOPLASM

	Tumor type	Clinical features	Morphology	IHC	Molecular features	Prognosis
	**Eosinophilic solid & cystic RCC**	Mostly females, ≤10% in TSC patients	Solid and cystic, eosinophilic cytoplasmic; coarsely granular, basophilic cytoplasmic stippling	**CK20+/-** CK7-, CD117– **Cathepsin K+**	Somatic bi-allelic loss or mutations of *TSC1* and *TSC2*	Favorable; rare cases aggressive
	**SDH-deficient RCC**	~0.1% of all RCC Solid and cystic ~30% multifocal or bilateral	Uniform cytology, flocculent cytoplasm, intracytoplasmic vacuolations or inclusions, round-oval low-grade nuclei	**SDHB-** CD117- CK7-	Germline mutations of genes encoding SDH subunits	Variable behavior; 11% metastatic
	**Acquired cystic disease-associated RCC**	ACKD patients on long-term dialysis; often multiple & bilateral	Tubulocystic/papillary; microlumen formation, eosinophilic cells with large nuclei and prominent nucleoli; intratumoral oxalate crystals	**AMACR+ CD10+** CK7-, CAIX- CD117-	No essential alterations	Usually indolent; can be aggressive
	**TFEB amplified RCC**	Older patients	High-grade poorly differentiated RCC with frequent oncocytic and papillary features	**Melan A+/- Cathepsin K+** HMB45 +	Amplification of 6p21 locus harboring TFEB (TFEB overexpression)	Poor outcome
	**Epithelioid AML (EAML)**	~5% of all AML More common in TSC	80% epithelioid cells; lacks significant amount of intratumoral fat & malformed vessels; epithelioid morphology	**CK-**, HMB45+ Melan A+ Cathepsin K+ S100+, **PAX8-**	Mutations of TSC2 reported in sporadic EAMLs	Malignant behavior may occur

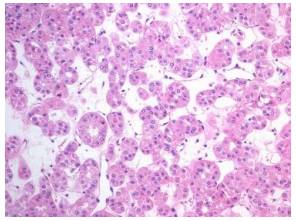
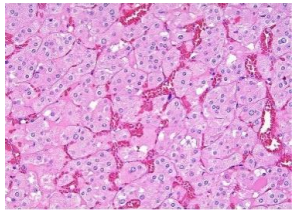
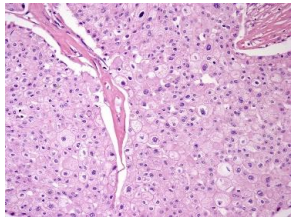
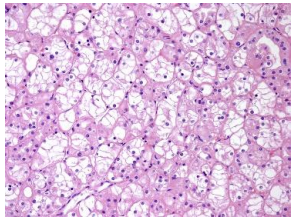
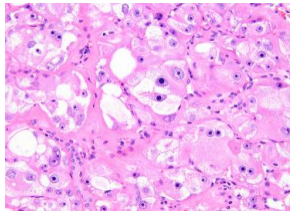
Pink











- **Stay calm: common things happen commonly!**
- Review clinical history & gross appearance
- Identify predominant morphologic pattern (clear, papillary, eosinophilic….)
- Is it low-grade or high-grade?
- Exclude things you cannot afford to miss (FH-deficient, ALK, medullary, SDH-deficient, TFEB amplified) with key IHC markers

THANK YOU!

cmagigalluzzi@uabmc.edu
